SURFACE WATER ASSESSMENT

1 INTRODUCTION

1.1 BACKGROUND

SLR Consulting was retained by Vulcan Materials Group and Morien Resources Corporation (the Proponent) to conduct a hydrologic assessment of a proposed Black Point aggregate quarry in Guysborough County, Nova Scotia. The assessment and description of hydrologic conditions within the vicinity of the site is a requirement outlined in the *Guide to Preparing an EA Registration Document for Pit and Quarry Developments in Nova Scotia* (NSE 2009).

1.2 SITE DESCRIPTION

The proposed Black Point Quarry Project is located on a 354.5 ha property along the south shore of Chedabucto Bay, approximately 4.0 km east of Fox Island in Guysborough County, Nova Scotia.

The proposed quarry land is currently zoned by the MODG as Industrial Heavy (I-2).

The site is greenfield (undeveloped) and covered by thin soils, which sustain tall shrub and some coniferous forest. The site features several wetlands and a lake (Fogherty Lake). Topography on the site slopes in all directions away from a granite hill, located within the southern central part of the site.

1.3 PROPOSED DEVELOPMENT

The proposed quarry is located on the abovementioned hill which has minimal overburden on top of the granite. The base of the quarry will be at approximately 30 m below mean seal level (<130 m deep) and will occupy a footprint of 180 ha. Processing including secondary crushing, screening, and washing will be undertaken on a 28 ha “lower platform” situated between the quarry and the coastline. The aggregate will be exported by ship via a marine terminal and load-out facility, north of the processing platform.

1.4 OBJECTIVES

The objectives of this hydrologic assessment are based on Section 6.1.2 of the *Nova Scotia Pit and Quarry Guidelines*:

1. Provide a general description of the hydrologic conditions and water quantity and quality for all surface waters in the vicinity of the proposed quarry;

2. Discuss and quantify the predicted effects the quarry activity may have on existing surface water quantity, both on-site and downstream of the quarry area;
3. Estimate the total change in surface water runoff amounts for the existing and proposed quarry development;
4. Estimate the total required capacity of the detention/siltation facilities (i.e. detention ponds) for the existing and proposed conditions (i.e. full quarry expansion) in order to meet acceptable liquid effluent discharge concentrations as defined in the *Guidelines*; and
5. Assess any potential impacts of the proposed quarry expansion on downstream surface water components with respect to water quantity and quality and propose mitigation measures to minimize any potential effects.

2 BASELINE HYDROLOGY

The following section provides a description of baseline hydrological conditions of the site including rainfall, evaporation, storm intensities, catchments and watercourse network.

2.1 CLIMATE

Climate data including historical average total monthly precipitation and average monthly temperature were obtained from Government of Canada Climate website¹. Deming Station, located approximately 15 km south of the proposed quarry, was chosen due to the large amounts of continuously recorded data dating between 1954 and 2011. This station (station 8201410) is located at coordinates 45.22N, -61.18W. Average climate conditions for the site were calculated using 30 year averages for data from 1975 to 2005. Data for years subsequent to 2005 were incomplete and not used in the calculation. A summary of climate norms is presented in Table 2-1.

As common on the eastern coast of Canada, the region's climate is influenced by the Atlantic Ocean and is characterised by mild winters and cool summers. Average monthly temperatures range from -0.5°C to -4.4°C from December to the end of March and from 11.1°C to 17.3°C from June through September.

The Deming, NS Climate Station recorded an average annual total precipitation of 1426.17 mm over a thirty year period consisting of 1311.8 mm of rain and 114.3 cm of snow.

¹ http://climate.weather.gc.ca/climate_normals/index_e.html

TABLE 2-1: SUMMARY OF CANADA CLIMATE NORMS FOR STATION 8201410, DEMING, NS (1975-2005)

Parameter	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Ave.
Mean Temp (°C)	-4	-4.4	-1.4	2.5	6.6	11.1	14.7	17.3	15	10	4.9	-0.5	6.0
Mean Max Temp (°C)	-0.5	-1.1	1.4	5.3	9.7	14.3	17.4	20.2	18	12.7	7.6	2.7	9.0
Mean Min Temp (°C)	-7.5	-7.6	-4.3	-0.3	3.5	7.8	11.8	14.5	12	7.2	2.1	-3.7	3.0
Extreme Max Temp (°C)	10.5	10	11	20	24	31.1	30	28.5	26	20.5	18.5	12	20.2
Extreme Min Temp (°C)	-25	-23	-19	-11	-3.5	1	4.5	7	2	-2.2	-12	-23.5	-8.7

Parameter	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Total
Average Total Rain (mm)	90.4	66.5	97.1	121.9	112.9	99.8	103.2	93.3	115.5	149.5	140.9	120.7	1311.7
Average Total Snow (cm)	29.1	27.7	21.2	9.4	0.6	0	0	0	0	0	4.6	21.7	114.3
Average Total Precipitation(mm)	119.5	94.2	118.3	131.3	113.5	99.8	103.2	93.3	115.5	149.5	145.6	142.4	1426.1

Table 2-2 presents Depth Duration Frequency (DDF) rainfall data for the site, which is taken as the average of Sable Island and Shearwater stations abstracted from the Government of Canada Climate DDFv2 dataset². These weather stations were selected from the database because of the long records used for estimation of the DDF data. The 1:100 year 24 hour rainfall depth averaged from Sable Island and Shearwater stations was compared against the average 1:100 year 24 hour depths for the three stations nearest to the site, which had over 40 years of data as provided by Environment Canada³, which gave a similar result (<0.5% difference).

TABLE 2-2: DEPTH DURATION FREQUENCY (DDF) RAINFALL – PROJECT SITE

Duration	Rainfall Depth (mm) and Frequency					
	1:2 years	1:5 years	1:10 years	1:25 years	1:50 years	1:100 years
5 minutes	6.3	8.3	9.6	11.3	12.6	13.8
10 minutes	9.2	11.8	13.6	15.8	17.5	19.1
15 minutes	11.5	14.6	16.7	19.4	21.3	23.2
30 minutes	16.1	20.5	23.3	27.0	29.7	32.3
1 hour	22.2	28.1	32.1	37.1	40.8	44.5
2 hour	30.3	39.2	45.2	52.7	58.2	63.7
6 hour	49.8	62.9	71.7	82.7	90.8	98.9
12 hour	60.9	77.5	88.5	102.5	112.8	123.1
24 hour	68.7	89.6	103.4	120.9	133.8	146.7
2 Day	79.5	108.0	127.0	150.9	168.6	186.3
5 Day	98.6	127.9	147.4	171.9	190.1	208.2

² http://climate.weather.gc.ca/prods_servs/engineering_e.html and ftp://ftp.tor.ec.gc.ca/Climate_Services/

³ Email from climate.atlantic@ec.gc.ca dated 26 January 2015

10 Day	127.2	163.8	188.1	218.8	241.5	264.1
15 Day	154.5	194.5	221.0	254.5	279.3	303.9
30 Day	221.0	270.0	302.5	343.5	373.9	404.1

Storm intensities are predicted to increase in this region due to the effects of climate change (Richards and Daigle 2001) as follows:

- 1980s – 0% (1980 is the base decade against which increases are compared).
- 2020s – 5% above 1980s values.
- 2050s – 9% above 1980s values.
- 2080s – 16% above 1980s values.

2.2 EVAPOTRANSPIRATION

Evapotranspiration has been calculated at 549 mm/year calculated using the Thornthwaite equation requiring mean monthly temperature and latitude. Mean temperature and a factor for latitude combine to reflect the amount of energy available to contribute to potential evapotranspiration (PET).

2.3 TOPOGRAPHY

The topography of the site and surroundings is presented on Figure 2-1 which shows that site topography slopes in all directions away from a granite hill, located within the southern central part of the site. The granite hill has a maximum elevation of approximately 97 m above mean sea level (amsl).

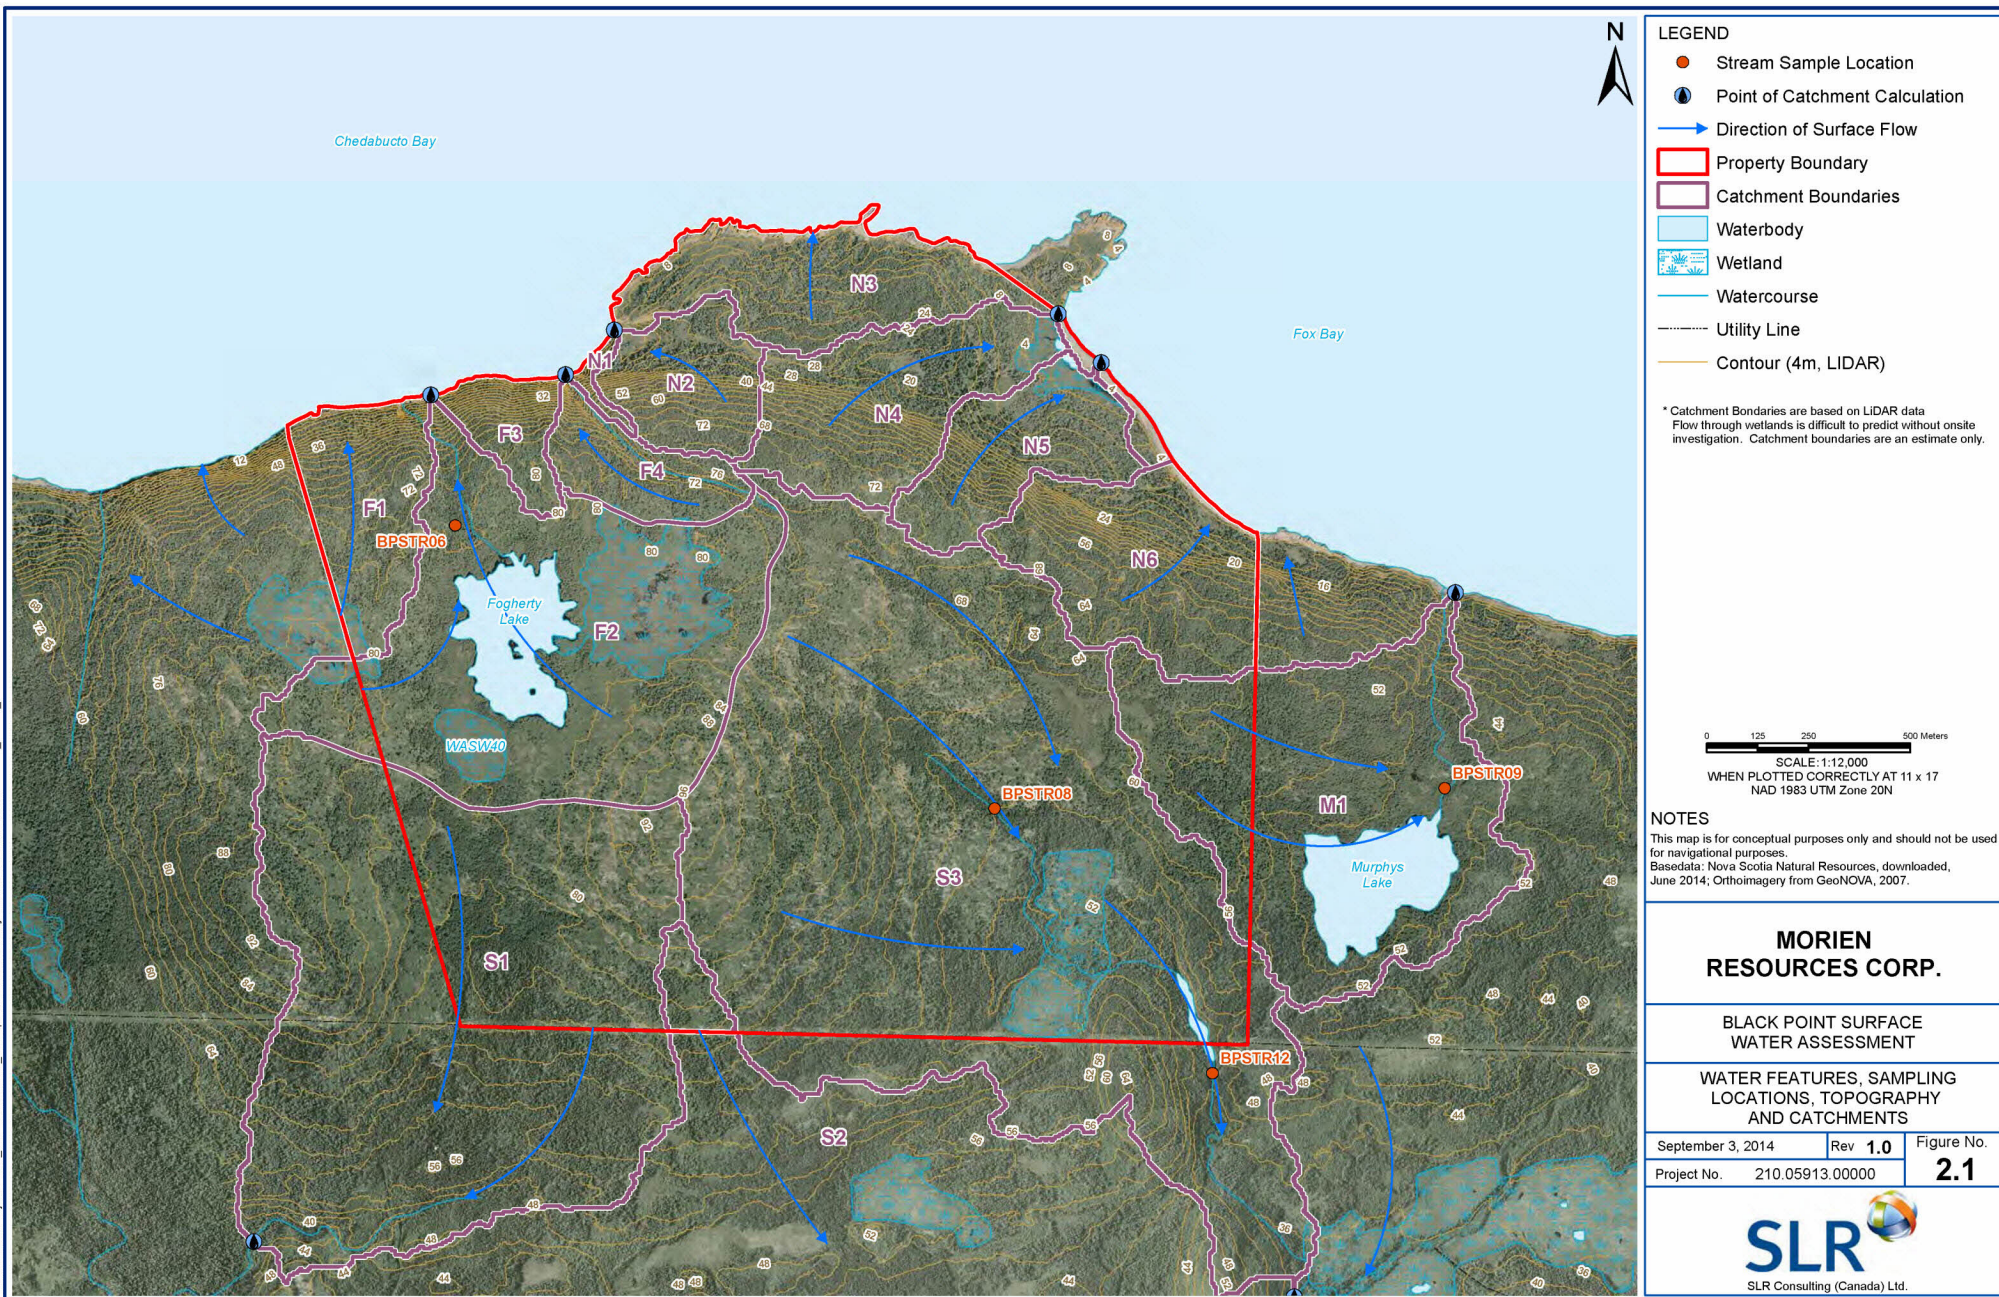

There is a marked break in slopes between the headland containing both Black Point and Fogerty Head, which forms a level plateau, and the rest of the site which raises sharply from 20-30 m amsl to 60 – 80 m amsl within just over 100 m. With the exception of this steep slope, the rest of the site is gently undulating.

2.4 WATER FEATURES AND CATCHMENTS

As presented on Figure 2-1 the site features numerous wetlands and a lake (Fogherty Lake), suggesting that relatively low infiltration rates are typical. This is supported by considering the elevation of Fogherty Lake, in which water levels are sustained at approximately 80m amsl and in relatively close proximity to the coast line.

Fogherty Lake is a shallow waterbody surrounded by trees, barrens and exposed rock. The water is clear but darkly tea-coloured, and visibility is nil at approximately one metre depth. The lake substrate is exposed bedrock and large boulders. There is some woody organic debris on the lake bed, which has a strong sulfurous smell. Lake water is to be very acidic (pH in field=2.94) (AMEC 2011).

N:\Markham\Project Files_2014\210.05913 Blackpoint\3 Data & Analysis\2 GIS\1 MXDs\3.WRK\210_05913_WSD\divides.mxd

Three watercourses are identified within the site boundary and are described in full in AMEC's report (AMEC 2011), a summary of which is as follows:

- Watercourse 1 – flows from Fogherty Lake northwards into Chedabucto Bay. A beaver dam is located near the upstream end of the watercourse. Upstream of the dam, the channel is deep and wide and the substrate largely fines; downstream, the channel is a relatively narrow and shallow run with one area of natural deadwater. The northernmost 150m of this watercourse was not surveyed, as it flows down a steep dropoff; however, the dimensions and substrate of the downstream reaches appeared to be similar to the run portions of the channel (AMEC 2011). Flow was measured and water quality monitored approximately 10 m downstream from the discharge of Fogherty Lake at location BPSTR06. The channel varied from approximately 0.50 to 1.0 m wide and had a moderate slope. The stream bed consisted of gravel and varied sized boulders scattered throughout.
- Watercourse 2 – flows within a steep valley from the centre of the site in a north-westerly direction into Chedabucto Bay. There was a great deal of deadfall in the channel valley. The upstream reaches were dry at the time of the 2011 survey, and further downstream the stream was very shallow; this watercourse is probably ephemeral. The stream was dry in July and August, 2014. The last 220 m of this watercourse was inaccessible, as it flows down a steep slope to the ocean, as does Watercourse 1. However, the dimensions and substrate of the downstream reaches appeared to be similar to the rest of the channel (AMEC 2011).
- Watercourse 3 – flows south from the wetlands in the southeast part of the site, across the transmission line cut and towards another wetland system southeast of the site. This in turn is the headwaters of Reynolds Brook, which drains in a south-westerly direction, eventually discharging through Hendsbee and Coeeycoff Lakes into Tor Bay. The downstream portion of the assessed section is a large pool resulting from a beaver dam on the watercourse just south of the Site property line. Flows were measured and water quality monitored at two locations; BPSTR12 which is downstream of wetland 17, and BPSTR08 which is upstream of wetland 17. The discharge measurement at BPSTR12, also on Watercourse 3, was measured at the outflow of Wetland 1. The channel is 2.0 to 10.0 m wide with low, gradual banks, and moderate slope. The stream bed consisted primarily of a mix of small and large boulders. The discharge measurement was located at a narrow, well-contained section 1.0 m wide with large boulders on each side, and consistent flow throughout the section.

In addition to the abovementioned watercourses, the following significant off-site surface water resources are noted in close proximity to the site:

- South-West (off-site) Watercourse – runoff from the south-west of the site drains towards a watercourse (Reynolds Brook) which flows to the south-west into Hendsbee Lake, approximately 1.3km from the site.

- **Murphys Lake (Sample ID BPSTR09)** - runoff from the east of the site drains towards Murphys Lake which is located approximately 100 m east of the site. Murphys Lake drains to the north into Chedabucto Bay. The discharge measurement at BPSTR09 was measured approximately 20 m downstream from the discharge from Murphys Lake. The typical channel width was 1.0 m or less and had a moderate slope. The stream bed was muddy with fine gravel. The discharge measurement section was 0.80 m wide, had well-defined banks on each side, and had consistent flow throughout the entire section.
- **Fox Island Main Creek (Sample ID BPRST10)** - Fox Island Main creek drains a large wetland southeast of the Property and discharges north to Indian Cove approximately located 2.0 km east of the Property boundary. Water samples and discharge measurements were taken approximately 10 m upstream from the bridge crossing at Starks Road, Fox Island Main. The typical full-bank channel width is approximately 3.0 m wide, with high banks and a moderate slope. The stream was in low-flow conditions at the time of July and August, 2014 measurements. The stream bed consisted of a mix of gravel and small boulders. The discharge measurement section was 1.1 m wide, well-defined with boulders at each bank, with flow concentrated primarily in middle of the cross-section and negligible at the banks.

As presented in Figure 2-1 the site can be split into 13 catchments which drain to the above mentioned receptors or directly to the ocean.

As presented in Table 2-3, flow measurements were taken in five watercourses at the end of July 2014 and end of August 2-14 (AECOM 2014). The July flows were considered representative of dry (baseflow) conditions (no precipitation for the three days prior to measurements), showed flow out of Fogherly Lake in Watercourse 1 to be 0.03 L/s and flow out of the southeast wetland in Watercourse 3 to be 7.7 L/s. The August flows were also considered representative of low flow conditions and measured flows were consistently lower than during the July round of measurements.

For comparison, estimates of mean annual runoff for these locations suggest higher flows would be more common at other, wetter, times of the year, in the order of 15 L/s in Watercourse 1 and 31 L/s in Watercourse 3.

Table 2-3: Stream discharge summary

Sample ID	Location Description	Discharge (L/s)	Dates Measured (2014)
BPSTR06	Fogherty Lake Outflow Watercourse 1	0.031 / 0	July 30 / Aug 27
None	Watercourse 2	0 / 0	July 30 / Aug 26
BPSTR08	Wetland 17 Inflow Watercourse 3 Upstream	0 / 0	July 30 / Aug 26
BPSTR09	Murphys Lake Outflow	0.170 / 0	July 31 / Aug 27
BPSTR12	Wetland 1 Outflow (Watercourse 3 downstream)	7.73 / 0.325	July 31 / Aug 27

2.5 MEAN ANNUAL RUNOFF

Rain falling onto a catchment either evaporates, infiltrates to groundwater, or runs off as storm water. Undertaking a basic water balance allows the mean annual runoff from the site to be estimated as detailed below:

- Mean Annual Precipitation – 1426 mm (as presented in section 2.1).
- Mean Annual Evapotranspiration – 549 mm (as presented in section 2.2).
- Mean Annual Infiltration – adopting factors to account for the slope, soils types, and vegetation cover (OMOE 2003), allows an infiltration factor to be estimated:
 - Topography is classified as rolling to hilly, with an infiltration factor of 0.15.
 - Soils are shallow and peaty, with an infiltration factor of 0.1.
 - Vegetation is thicket and shrub, with an infiltration factor of 0.15.
- From the above, an infiltration factor of 0.4 is estimated (the sum of each of the above components). When this factor is multiplied by the net precipitation (calculated as precipitation – evapotranspiration), an annual infiltration of 351 mm is derived.
- Mean Annual Runoff – calculated to be 526 mm based on the net precipitation (877 mm) minus infiltration (351 mm). When applied to the entire 354.5 ha site, this gives an annual runoff of 1 865 592 m³ which equates to an average flow of 59 L/s leaving the site.

2.6 PEAK FLOW RATES AND FLOOD VOLUMES

The peak flows and flood volumes generated by the site during baseline and developed conditions were estimated using the SCS Method within the HydroCAD software package. The following parameters were used:

- Rainfall – 24 hour storm depths were adopted based on the DDF storm data presented in Table 2-2, and a Type II storm profile was adopted which is considered applicable for most parts of Canada (LSRCA 2013).

- Catchment Area – the total site area of 354.5 ha is used.
- Curve Number – taking into account the shallow soils over much of the site, which readily generate runoff, and the shrub vegetation coverage, a curve number of 82 is used.
- Time of Concentration – estimated from longest flow pathway (approximately 1,000 m) and average gradient (0.03) to be 44.5 minutes for the pre-development site.

The peak flows and flood volumes for the site are presented in Table 2-4.

TABLE 2-4: PEAK FLOWS RATES AND FLOOD VOLUMES

Flood Hydrograph	1:25 years	1:100 years
Peak Flow (m ³ /s)	47	62
Flood Volume (m ³)	258 000	341 000

2.7 WATER QUALITY

Water quality monitoring was undertaken at 5 locations on 31st July 2014 and is described in detail in Section 6.2 and Appendix A of the Main Report; a summary of the key findings are presented below. The analytical results were compared against Canadian Water Quality Guidelines (CWQG) for the Protection for Aquatic Life (PAL) Freshwater Guideline Update 7.0 (CCME 2007). The results indicate:

- pH was low (4.33 – 4.70) in all 5 samples and is outside of the acceptable CWQG PAL guideline range (6.5-9.0).
- Lead slightly exceeded the CWQG PAL guidelines at two locations.
- Iron was elevated (320 – 1600 ug/L) in all 5 samples and exceeded the CWQG PAL guidelines (300 ug/L).
- Cadmium was above the CWQG PAL guidelines at one location (0.09 ug/L).
- Ammonia was elevated (0.08 – 0.086 mg/L) in 2 samples and exceeded the CWQG PAL guidelines.
- Aluminium was elevated (270 – 820 ug/L) in all 5 samples and exceeded the CWQG PAL guidelines (5 ug/L).

The pH of surface water features is low and colour of water is typically dark brown, both characteristics are thought to be attributable to the peaty soils which are common across the site. The high pH is likely to be the cause of the elevated concentrations of dissolved metals within the samples.

2.8 SOILS AND GEOLOGY

The regional geology consists of Ordovician-age metamorphosed sedimentary rocks of the Halifax and Goldenville formations that were intruded by Devonian-age granite (Stea and Dickie 1977). The granite will be quarried to produce crushed-stone aggregate.

Based on information collected from 11 boreholes completed within the granite, this unit is fractured to approximately 15 m below ground level (bgl) and groundwater levels are shallow, generally found between 2 and 4.5 m bgl.

Soils in this area belong to the Rockland series and are described as having “excessive to poor” drainage and characterised as having “extreme shallowness” (Hilchey 1964).

2.9 VEGETATION

Most of the area is covered by a mosaic of barren vegetation, tall shrub barren, and some coniferous forest. There are also patches of mixed forest, and wetlands such as treed bog, open bog, fen, and swamp scattered throughout the site. A number of other habitat types are also present, including beaches, coastal barren headlands, coastal cliffs, regenerating forests, and lakes.

3 POTENTIAL POST DEVELOPMENT CHANGES

The quarry development has the potential to affect the baseline hydrology in the following ways:

- Mean Annual Runoff – alteration of topography / drainage routes, removal of topsoil / vegetation, and use of water for processing requirements may impact the volumes of runoff discharged from the site thereby affecting flow dependent receptors within the downstream environment.
- Peak Flow – alteration of topography / drainage routes and removal of topsoil / vegetation may increase the peak flow of runoff discharged from the site thereby increasing the risk of flooding within the downstream environment.
- Water Quality – the use of chemicals, fuels, lubricants and explosives at the site and disturbance of soils, and rock has the potential to detrimentally impact upon the quality of water discharged from the site thereby affecting downstream environmental receptors.

These points are described in more detail below.

3.1 EFFECT ON MEAN ANNUAL RUNOFF

Following full development (50+ years) and without accounting for re-vegetation that will occur during progressive rehabilitation, the quarry and much of the lower platform will not retain any soils or vegetation, reducing the infiltration factor from 0.4 to 0.3 across approximately 57% of the total site. This reduction in infiltration will increase the runoff by 17% in these areas (208 ha), which equates to a 10% increase from the entire 354.5ha site to a mean annual runoff of 2 043 906m³ following development.

As discussed further in Section 4.1, measures are recommended to convey runoff from operational areas to one of two stormwater retention ponds, from where runoff will either be re-used on site or discharged to Chedabucto Bay, meaning that post development the mean annual runoff of several catchments will be reduced whilst runoff from N2, N3 and N4 will be substantially increased. The impact of full development on the mean annual runoff from the site is presented in Table 3-1.

TABLE 3-1: IMPACT OF DEVELOPMENT ON MEAN ANNUAL RUNOFF

Catchment	Baseline Scenario (Pre Development)		Post Development Scenario		% of Baseline Runoff
	Area (ha)	Mean Annual Runoff (m ³)	Area (ha)	Mean Annual Runoff (m ³)	
F1	14.4	75 573	14.4	75 573	100%
F2	61.5	323 504	36.8	193 743	60%
F3	5.8	30 387	5.8	30 387	100%
F4	8.7	45 767	3.9	20 621	45%
M1	13.2	69 481	4.6	24 237	35%
N1	1.0	5 401	1.0	5 238	97%
N2	11.0	57 684	27.8	169 414	294%
N3*	19.9	104 481	8.4	44 296	42%
N4*	21.5	113 040	91.3	557 914	494%
N5	14.4	75 632	93.8	571 322	755%
N6	22.4	118 041	5.7	30 193	26%
S1	31.9	168 101	17.4	91 373	54%
S2	2.9	15 100	1.5	8 053	53%
S3	126.1	663 399	42.1	221 542	33%
Total	354.5	1 865 592	354.5	2 043 906	110%

*Stormwater Discharge Point

It should be noted that this estimated impact on mean annual runoff discharged from the site does not take account of any collection and re-use of runoff for processing requirements at the site. However, since the processing water will be recycled and given the relatively low evaporation rates at the site, losses of processing water and consequent impact upon mean annual runoff will be minimal.

The estimated mean annual runoff from the quarry and lower platform areas which will drain into the stormwater ponds and will be available for re-use is likely to be 1 248 202 m³, which equates to an average flow of 40 L/s during the fully developed site. However, volumes of runoff are likely to be

much lower during the initial stages of site development and prior to excavation of the quarry, the mean annual runoff from the lower platform only is likely to be 161 467 m³ (5 L/s).

3.2 EFFECT ON PEAK FLOW RATES AND FLOOD VOLUMES

Of the total site area, the development will feature approximately 180 ha of quarry while the processing plant and stockpiles will occupy the 28 ha lower platform. Most of the vegetation and soils in these areas are likely to be removed and stockpiled, leaving bare rock surfaces. This tends to increase runoff volume and runoff velocity, which is represented as follows:

- Curve Number – for 208 ha of the site, an increased curve number of 91 is used.
- Time of Concentration – a reduced time of concentration of 37.4 minutes is used.

The hydrographs for the site during 1:25 year and 1:100 year events for pre-development and post development scenarios are presented in Figure 3-1 and Figure 3-2. The post-development hydrographs do not take into account the retention ponds discussed in Section 4.1 and are therefore representative of an un-mitigated scenario.

FIGURE 3-1: HYDROGRAPHS FOR BASELINE AND DEVELOPED SITE DURING A 1:25 YEAR EVENT

FIGURE 3-2: HYDROGRAPHS FOR BASELINE AND DEVELOPED SITE DURING A 1:100 YEAR EVENT

As can be observed in the un-mitigated post-development scenario, peak flows will increase by 11% for a 1:25 year event and 8% for a 1:100 year event while the volume of runoff generated post development will be increased by 17% for a 1:25 year event and 13% for a 1:100 year event.

It is considered that the increase in peak flow and flood volumes attributable to the development are relatively minor and given that there are no downstream receptors susceptible to flooding, these increases are not considered significant. Therefore, it is not considered necessary to attenuate peak flows on-site to ensure that the pre-development discharge rates are not exceeded.

3.3 EFFECT ON WATER QUALITY

It is not possible to quantitatively assess the un-mitigated impact of the development upon the baseline water quality conditions. Nonetheless qualitatively the impacts could be as follows:

- **Geochemistry** – quarrying activities may expose elements naturally occurring within soils and geology to rainfall and oxidation, potentially mobilising these elements into discharge from the site. From the water quality monitoring it can be seen that pH is low and aluminum, iron and lead are already found at elevated levels within the surface water environment.
- **Ammonia and Nitrate** - the use of Ammonium Nitrate-Fuel Oil (ANFO) blasting agents (consisting of inorganic nitrates and petroleum-based fuels) may leave explosives residues, high in ammonia and nitrate, within areas where blasting has occurred. These residues may be mobilised by runoff. From the water quality monitoring it can be seen that ammonia is already found at elevated levels within the surface water environment.

- Suspended Solids – quarrying activities will include stripping of vegetation and soils, as well as washing of crushed aggregate. These activities have the potential to increase the concentrations of suspended solids and silts within runoff discharges from the site.

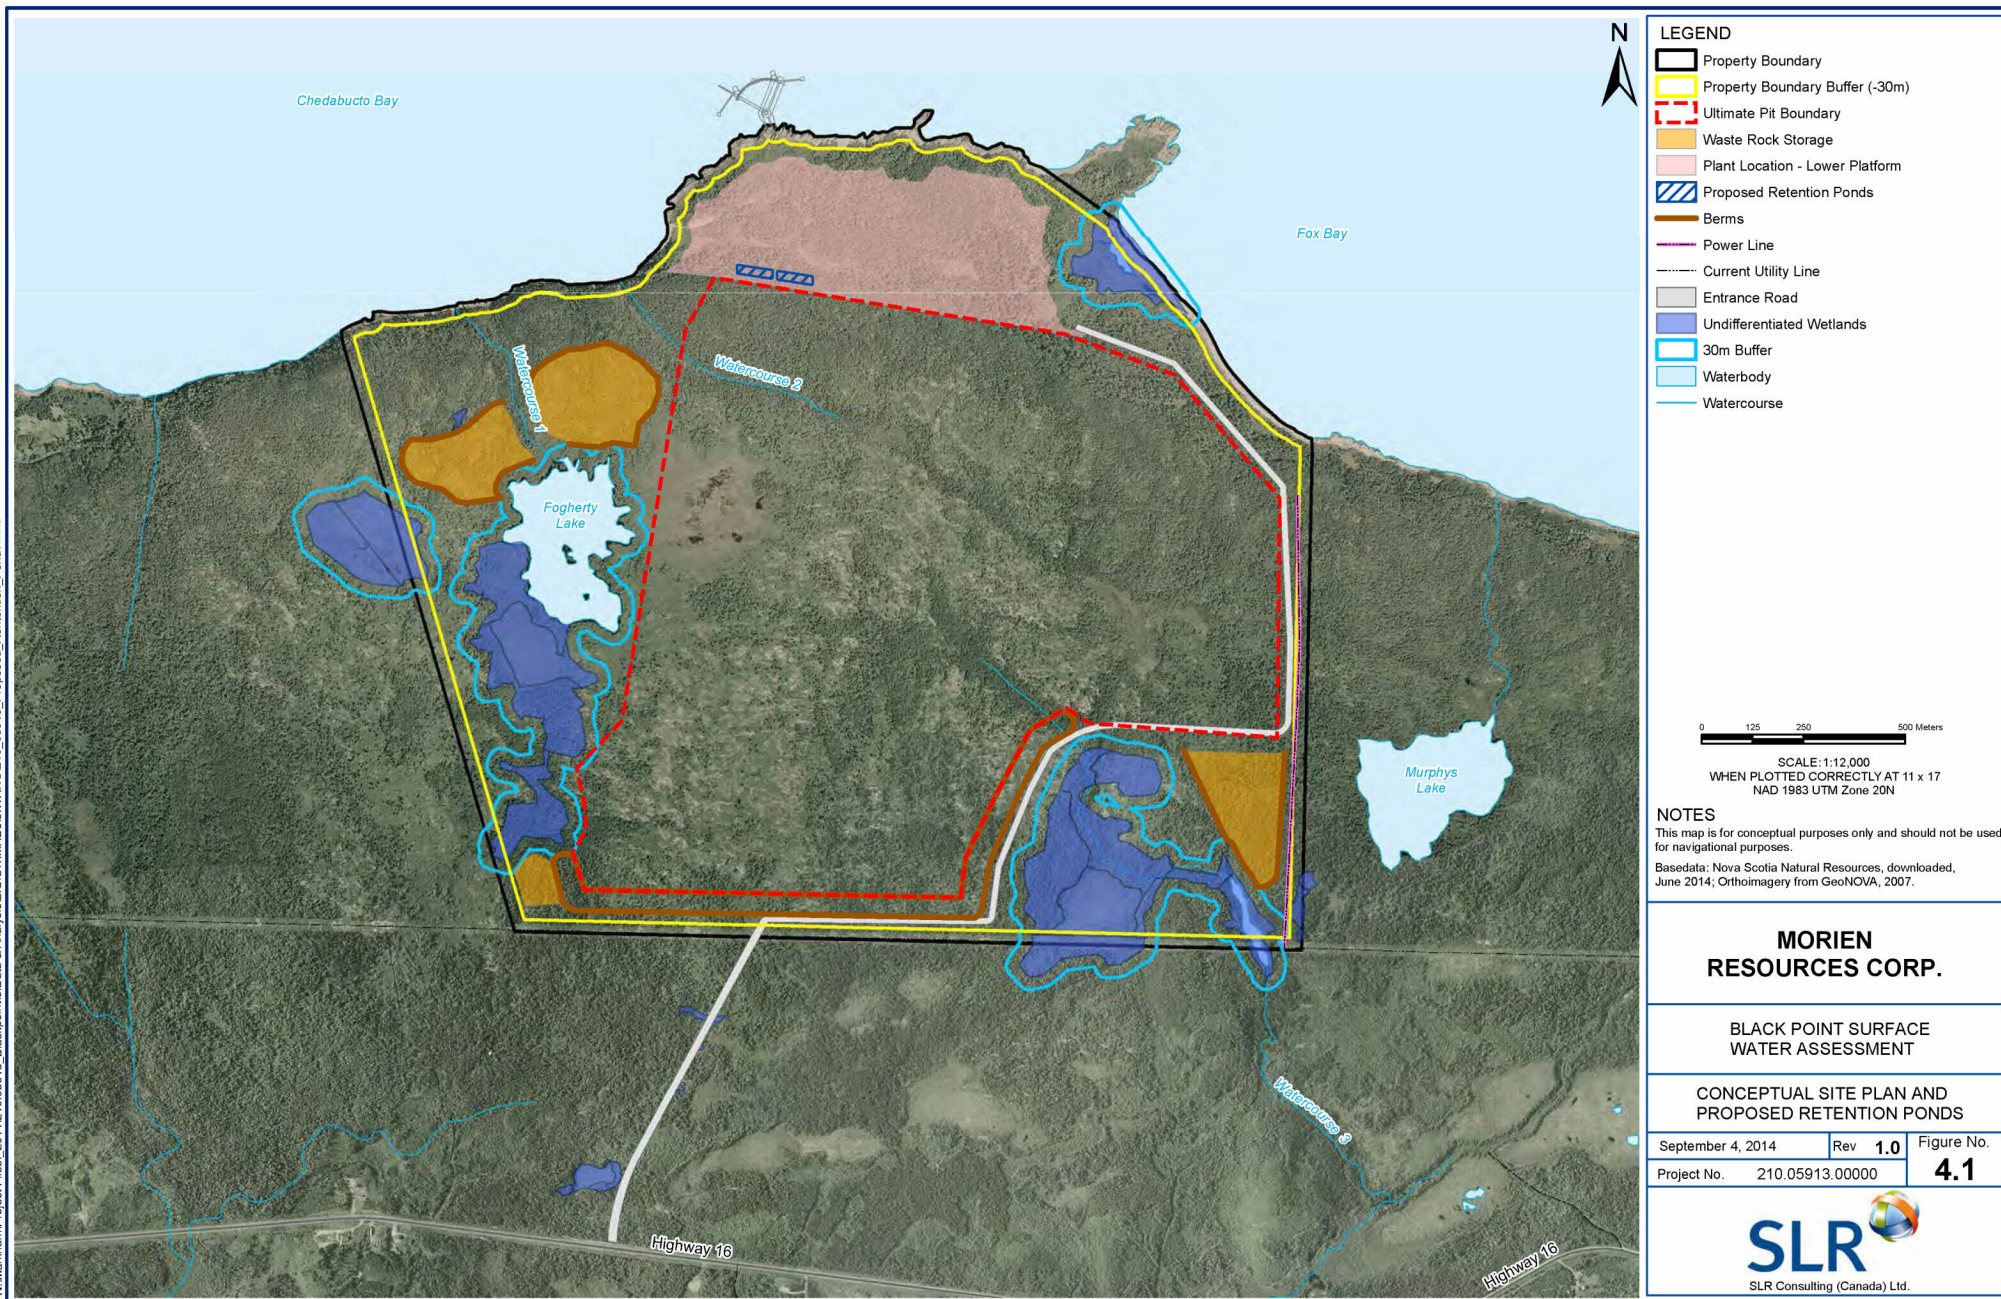

4 MITIGATION MEASURES

In order to reduce the potential impacts of the development on the baseline surface water environment as identified in Section 2, the following is recommended:

- Stormwater Retention Ponds;
- Fuel and Chemical Storage; and
- Discharge Monitoring.

4.1 STORMWATER RETENTION PONDS

Runoff from the working areas of the quarry and associated infrastructure will be conveyed to flow stormwater retention ponds as shown in Figure 4-1. These ponds should be constructed upstream of the final discharge point to improve the quality of water discharged from the site.

It is recommended that retention ponds are designed in accordance with Nova Scotia Department of the Environment Guidelines (NSE 1988) to intercept sediment laden runoff and allow sediment to settle out, thereby reducing the amount of sediment leaving the disturbed area, and protecting local watercourses from excessive sedimentation.

The recommended design features are as follows:

- **Permanent Pool** – a permanent volume of water is to be retained within the pond at all times to ensure treatment of all stormwater discharged from the site. It is recommended the permanent pool is sized to contain at least 190 m³ per ha of catchment (NSE 1988). Based on the mean annual runoff, this equates to 11 days of residence time within the pond prior to discharge.
- **Flood Conveyance** – flood events up to and including a 1:100 year event + 16 % for climate change should be conveyed through the pond and discharged via a spillway.

The following stormwater retention ponds are proposed:

- **Process Water Ponds** – during construction of the lower platform and access road, a series of process water ponds will be constructed to store runoff from the entire lower platform area. Once complete the entire lower platform will drain to these ponds and will be re-used for processing where required or discharged to Chedabucto Bay.
- **In-Pit Drainage Sump** – during the initial stages of quarrying a drainage sump will be created to intercept runoff generated within the footprint of the quarry in addition to any groundwater inflows to the pit, and water will either be used for processing where required or discharged to Chedabucto Bay.

The catchment areas, recommended retention pond sizes, and outflow controls are presented in Table 4-1 below:

TABLE 4-1: RECOMMENDED RETENTION POND DETAILS

Parameters	Process Water Ponds	In-Pit Drainage Sump
Catchment Area is (ha)	28	180
Mean Annual Runoff (L/s)	5.5	35.0
Permanent Pool Volume (m ³)	5 320	34 200*
Flood Conveyance – 1:100yr + 16% (m ³ /s)	7.5	33.0

*Theoretical design volume; the actual sump will have a smaller volume since any overflow would be contained within quarry limits

At this stage of the project, the above measures and design detail are considered indicative and as such, it is recommended that the drainage strategy be revisited during further design of the site.

4.2 FUEL AND CHEMICAL STORAGE

All fuels and chemicals stored or used on site should be contained within fit-for-purpose containers and stored within designated storage areas. In order to prevent pollution of the surrounding environment during an accidental spillage, the designated storage areas should be situated on an impermeable surface and should feature a perimeter bund and a drainage sump. The volume of the bund and sump should be sized to contain at least 110% of the total volume of the fuel and chemicals being stored within the designated storage area. The storage areas should feature a roof to prevent inflow of rainwater, which would require the sump to be emptied frequently.

4.3 DISCHARGE MONITORING

It is recommended that water quality monitoring is undertaken on the discharge from the retention ponds on a monthly basis and results compared against the baseline conditions.

Where guideline values and baseline are exceeded, it is recommended that a review of site activities should be undertaken to identify the source of pollution and remedial measures should be implemented to ensure that the quality of the discharge is improved.

5 CONCLUSIONS AND RECOMMENDATIONS

The site is 354.5 ha in area features 3 watercourses, numerous wetlands and a lake. The existing topography divides the site into 13 catchments. The mean annual runoff for the site is 1 865 592 m³ and the peak flows leaving the site are 34 m³/s for a 1:25 year event and 42 m³/s for a 1:100 year event. The baseline water quality shows low pH, elevated iron and aluminium concentration across all sampling locations.

Unless appropriately mitigated, the proposed quarry development has the potential to impact upon the baseline surface water quantity and quality.

It is proposed that runoff from the site is conveyed to stormwater retention ponds, to improve the quality of water discharged from the site and allow for settlement of suspended solids prior to discharge to the receiving environment. This will significantly reduce the mean annual runoff in some of the catchments identified at site and increase mean annual runoff at the discharge points.

The proposed development will increase peak flows by up to 16% during a 1:100 year event however, it is not considered necessary to attenuate peak flows on-site as no receptors susceptible to flooding because of the slightly increased peak flows were identified.

The following monitoring and maintenance is recommended during construction and operational phases of the site:

- Water Quality Monitoring – discharge from the retention ponds should be monitored to demonstrate compliance with the Nova Scotia Pit and Quarry Guidelines (NSEL 1999).
- Maintenance Retention Ponds – in order to maintain the function of the ponds as outlined above, it is recommended that silt is removed and the outflow controls are routinely checked for any potential blockages.

It should be noted that the above strategy is indicative only and should be revisited to take account of more detailed information which may be forthcoming during later stages of design or during the operational phases of the site, as detailed below:

- Site Development Phasing – as the site develops, catchment areas and drainage pathways will need to be considered and additional berms or ponds maybe required to prevent direct discharge of runoff from working areas to any surrounding receptors.
- Site Water Requirements – water will be required for operational and processing activities at the site. It is recommended that this is considered through an operational water balance for the site, to confirm whether the operation is water positive and excess water needs to be discharged, or whether the operation is water negative and further makeup water will need to be abstracted.
- Groundwater Inflow – in addition to runoff collecting within the pit, it is anticipated that groundwater seepage into the pit may need to be managed. Given the close proximity to the coastline and the deep nature of the quarry, it may be that seawater seeps into the pit, which may impact upon the natural salinity of surface water receptors if pumped out alongside runoff.
- Settlement Velocities – during initial phases of construction, samples of the runoff entering the stormwater ponds should be taken during storm events. Samples should be left to stand and the settlement velocity should be observed to confirm the design of the retention ponds.

EXECUTIVE SUMMARY

This report describes the potential noise and vibration impacts of the Black Point Quarry Project, as part of the Environmental Impact Assessment in accordance with the requirements of the Canadian Environmental Assessment Agency and Nova Scotia Environment. The objective of this report is to identify the existing ambient noise and vibration levels within the local area and provide information on typical existing sound sources, and their geographic extent and temporal variations. Existing ambient noise levels were previously measured in a baseline ambient noise survey. The noise and vibration impacts of the Project have also been identified, and recommendations made for mitigation of noise impacts during future aggregate production.

The assessment of Project noise and vibration has considered the following potential areas of impact:

- Construction noise and vibration, both terrestrial and underwater
- Noise from aggregate production and shiploading operations
- Noise and vibration from blasting, including impacts on people and structures and the potential for underwater impacts on wildlife.

This report also discusses the potential *perceived* noise and vibration impacts of the project, since impacts on people may exist even if compliance with numerical noise and vibration criteria is achieved.

Existing Noise and Vibration Environment

The existing noise environment has been determined by measurement at two representative geographic locations (one inland, and one nearer the coast). These locations are the residential receptors located nearest to the Property boundary. As is expected for a remote rural environment, existing background noise levels (L_{90}) are very low, below 30 dBA in all time periods at both locations. At each location, little temporal variation was observed in background noise levels throughout the daytime, evening and night-time. The location near the coast had slightly higher background noise levels than the inland location. However, the average noise levels (L_{eq}), which include the contribution of short-term noise events, were higher at the inland location, probably due to the influence of road traffic noise.

At the measurement location west of the project site near the coast, the dominant noise sources noted were natural, including waves, birds, and the movement of leaves. At the location further inland traffic noise from the road was observed, in addition to natural noise sources.

Ambient vibration levels in the study area have not been measured. Since this is a rural/remote location with no existing anthropogenic vibration sources nearby, existing ambient ground and seabed vibration levels are expected to be low, below the thresholds of human perception and below levels that would affect marine fauna.

Ambient underwater noise levels in the study area have also not been measured. While there are no existing fixed anthropogenic sources of underwater noise and vibration, underwater noise can propagate over very large distances. For this reason, both natural and anthropogenic sources may contribute to the existing underwater noise environment in the project area. Natural underwater noise sources include wind, waves, precipitation, sea ice, marine fauna, and seismic background activity. Anthropogenic noise sources include commercial fishing and

shipping traffic, seismic exploration activity, sonar equipment, construction and industrial activity, and distant explosive detonations. Whether natural or anthropogenic sources dominate at any particular time and location depends on changing natural conditions, and the proximity and level of the human activities.

Project Construction Noise and Vibration Impacts

The site development and initial rock processing that will occur during the construction phase of the Black Point operation will involve activities similar to the activities that will occur during full facility operation. The equipment used for the construction will be similar to that used for site operation. The noise generated from the construction activities is anticipated to be similar to the noise generated from facility operations.

The construction of the marine terminal has the potential to impact on the underwater noise and vibration environment, however these impacts would be temporary and localised to the immediate construction area. It is estimated that the underwater noise criteria for lethal impacts on fish (including shellfish and crustaceans) may be exceeded during piling, in an area around the pile location extending up to 10 m. Behavioural modification may occur at greater distances, for the duration of the piling activity.

Project Operational Noise Impacts

The Black Point operation will generate noise from the operation of mobile equipment, the operation of the processing plant, blasting, and product loadout at the marine terminal. The Pit and Quarry Guidelines require that noise levels at the boundaries of the project site are not to exceed the following levels:

- $L_{eq} \leq 65$ dBA between 0700 to 1900 hours (daytime)
- $L_{eq} \leq 60$ dBA between 1900 to 2300 hours (evening)
- $L_{eq} \leq 55$ dBA between 2300 to 0700 hours (night-time, Sunday and statutory holidays)

The assessment of unmitigated worst case noise emissions for the future (fully developed) quarry indicates there is potential for future exceedance of the noise criteria at the site boundary. These impacts can be mitigated by a combination of reasonable and feasible measures such as having the majority of mobile equipment operating in the pit below ground surface, retaining natural barriers such as hillsides to the extent possible, locating product stockpiles to block noise transmission, and by specifying best practice quiet equipment during procurement. A combination of these measures will ensure that the site complies with the Pit and Quarry Guidelines established for operational sound levels.

The nearest sensitive residential receivers are set back from the property boundary, and the predicted noise levels at all residential locations are expected to comply with the applicable operational noise criteria. While compliance with the numeric noise limits at residences is expected, the noise of the quarry will be noticeable, particularly during otherwise quiet periods. Quarry production noise is generally characterised by low-frequency “rumbling” noise that does not vary much with time.

At the levels predicted in this assessment, it is anticipated that future noise from the quarry will dominate the background noise environment in the local area during the daytime and evening periods, and will be audible at “moderate to quiet” levels in nearby residential areas. Noise from

night-time shiploading will also contribute to the background noise environment and be audible at a “quiet” level in nearby residential areas. The night-time noise level would not be expected to disturb the sleep of most people.

Blasting Noise and Vibration Impacts

Blasting will occur anywhere from 30 to 120 days per year, depending on aggregate sales demand. The NSE *Pit and Quarry Guidelines* define acceptable limits for blast overpressure (noise) and vibration, and also require a minimum distance from blasting to the nearest off-site structure greater than 800 m. Minimum blasting distances are respected in all directions from the Property boundary.

The assessment indicates that exceedance of the airblast overpressure limit and vibration limit at sensitive receivers is unlikely throughout the life of the quarry. As required by the NSE *Pit and Quarry Guidelines*, all blasts would be monitored to establish overpressure and vibration levels. This monitoring would be used to develop site-specific propagation constants, to enable refinement of the blast overpressure and vibration predictions as the quarry develops. In this manner, blast designs can be adopted that comply with the overpressure and vibration limits at sensitive receivers throughout the life of the quarry.

While underwater blasting is not anticipated to be required by the Project, the location of the quarry adjacent to the ocean means that there is potential for quarry blasting noise and vibration to impact on the underwater environment and marine fauna. This assessment identifies indicative offset distances between a blast and the ocean to meet the underwater noise and vibration limits defined in *Guidelines for the Use of Explosives In or Near Canadian Fisheries Waters*. It is recommended that these indicative setback distances be refined following monitoring of initial test blasts at the site. Depending on their proximity to ocean habitats, these initial blasts may need to take place outside of any identified spawning periods for marine fauna. These initial blasts would identify the site-specific vibration transmission characteristics, to enable design of blasts to comply with the underwater noise and vibration limits.

1.0 INTRODUCTION

Morien Resources Corporation and Vulcan Materials Company (the Proponent) proposes the construction, operation, decommissioning, and abandonment of a granite quarry at Black Point in Guysborough County, Nova Scotia, and the construction and operation of a marine terminal and load-out facility, adjacent to the quarry, in Chedabucto Bay. The quarry is expected to have a production capacity of up to 7.5 million tonnes of granite per year, over a mine life of approximately 50 years.

This report describes the potential noise and vibration impacts of the Project, as part of the Environmental Impact Statement (EIS) in accordance with the requirements of the Canadian Environmental Assessment Agency (CEA Agency) and Nova Scotia Environment (NSE). The objective of this report is to describe the existing acoustic environment, to predict the noise and vibration impacts of the Project, and to assess the predicted noise levels against relevant criteria. This report also discusses the potential noise and vibration impacts of the project, since impacts on people and wildlife may exist even if compliance with numerical noise and vibration criteria is achieved.

1.1 Project Area

The Project is located in a rural setting with little industrial, commercial or residential development. The local region is generally a rural forested area with an existing noise environment dominated by natural sounds. There is occasional noise associated with forest resources harvesting, some recreational activity (all-terrain vehicle and snowmobile use, hunting), and noise associated with residential land use and traffic along Highway 16 and residential access roads.

A desktop survey of the Project area using topographic maps indicates there are no residences within 500 m of the Property boundary, one residence at 690 m, two within 750 m, seven residences within 875 m, 11 within 1.0 km, and fewer than 45 within 2.0 km. The Project study area for noise and vibration impacts is shown in Figure 1.

1.2 Relevant Guidelines

The following guideline documents are relevant to the assessment of noise and vibration impacts of the Project:

- Canadian Environmental Assessment Agency *Guidelines for the preparation of an Environmental Impact Statement pursuant to the Canadian Environmental Assessment Act, 2012 and Nova Scotia Registration Document pursuant to the Nova Scotia Environment Act Black Point Quarry Project, Morien Resources Corp.* June 9, 2014 (the CEAA EIS guideline)
- Nova Scotia Environment and Labour *Guidelines for Environmental Noise Measurement and Assessment.* April 1990, amended May 18 2005.
- Nova Scotia Environment *Guide to Preparing an EA Registration Document for Pit and Quarry Developments in Nova Scotia.* Revised September 2009.
- Nova Scotia Environment *Pit and Quarry Guidelines.* Revised May 1999.
- Fisheries and Oceans Canada *Guidelines for the Use of Explosives In or Near Canadian Fisheries Waters.* Canadian Technical Report of Fisheries and Aquatic Sciences 2107. D.G. Wright and G.E. Hopky, 1998.

1.3 Terminology

Specific acoustic terminology is used in this report. An explanation of common acoustic terms is provided in Appendix A.

This report considers noise and vibration impacts on land and also underwater. If the type of impact is not specifically indicated, it is a land-based impact. Underwater noise and underwater vibration impacts are described as such.

Figure 1
Project Study Area

2.0 CRITERIA

2.1 Noise Criteria

In 1990, the then Nova Scotia Department of Environment and Labour (NSEL, now the NSE) developed environmental guidelines to allow the evaluation of noise pollution in the environment (*Guidelines for Environmental Noise Measurement and Assessment*). Industrial operations which require an Environmental Approval come under the jurisdiction of this Guideline. The noise criteria defined by this guideline are A-weighted average sound pressure (L_{eq}) limits applicable at locations where people normally live, work, or take part in recreation. The criteria are as follows:

- $L_{eq} \leq 65$ dBA between 0700 to 1900 hours (daytime)
- $L_{eq} \leq 60$ dBA between 1900 to 2300 hours (evening)
- $L_{eq} \leq 55$ dBA between 2300 to 0700 hours (night-time, Sunday and statutory holidays)

The NSE *Pit and Quarry Guidelines* also define noise limits identical to the daytime, evening and night-time limits listed above. Although the magnitude of the noise limits is the same in both guidelines, the *Pit and Quarry Guidelines* require that the limits be observed at the property boundaries of the pit or quarry. This is more stringent than the requirements of the *Guidelines for Environmental Noise Measurement and Assessment*, since residences are set back from the quarry property boundary. Therefore, this study predicts the noise impacts at the quarry property boundary for assessment against the noise criteria.

Quarry noise levels at the nearest residential properties are also described, to enable a discussion of the predicted effects on residents in accordance with the guidance contained in the NSE *Guide to Preparing an EA Registration Document for Pit and Quarry Developments in Nova Scotia*. This guide also recommends a discussion of the effect of increased noise levels on wildlife.

2.2 Vibration Criteria

The NSE *Pit and Quarry Guidelines* do not define vibration criteria, with the exception of specific limits for blasting (see Section 2.3). Instead, separation distances are defined for pit and quarry operations. These separation distances require that the excavation working face of a pit be located no less than 90 m from the foundation or base of a structure located off site. The Project will comply with these separation distances. Adverse vibration impacts from excavation activities and general operation of the site are not anticipated and are not considered further in this assessment; with the exception of blasting vibration impacts (see Section 8.2).

2.3 Noise and Vibration Criteria Specific to Blasting Activities

The NSE *Pit and Quarry Guidelines* require a separation distance for blasting of 800 m, measured from the point of blast to a structure off site. In addition to this separation distance, this guideline defines noise and vibration criteria and control measures specific to blasting activities (NSE *Pit and Quarry Guidelines* Section VIII. Blasting). These criteria and control measures are reproduced as follows:

- (1)(a) *No person responsible for the operation of a quarry shall permit any blasting on site to exceed the following limits:*

<i>Concussion (Air Blast) 128 dBA</i>	<i>Within 7 m of the nearest structure not located on the property where the blasting operations occur, or other locations as directed by the Minister or Administrator.</i>
<i>Ground Vibration 0.5 in./sec. (12.5 mm/s) Peak Particle Velocity</i>	<i>Measured below grade or less than 1 m above grade in any part of the nearest structure not located on the property where blasting occurs, or other locations as directed by the Minister or Administrator.</i>

- (1)(b) *No person shall fail to monitor all blasts for the parameters outlined in VIII(1)(a).*
- (2) *Monitoring results shall be forwarded to the Department on a monthly basis unless otherwise indicated.*
- (3) *No blasting shall occur on Sunday, on a statutory holiday prescribed by the Province, or on any day between the hours of 1800 hours and 0800 hours.*
- (4) *Every person responsible for the operation of a quarry shall have a technical blast design prepared by a qualified person which ensures the ground vibration and air concussion outlined in VIII (1) can be achieved.*
- (5) *Every person responsible for the operation of a quarry shall conduct a preblast survey of all structures within 800 m of the point of blast. This survey should be conducted with Nova Scotia Environment and Labour's "Procedure For Conducting a Pre-Blast Survey".*
- (6) *No blasting is to take place if a thermal inversion is anticipated at the time of the proposed blast.*

2.4 Underwater Noise and Vibration Criteria

In addition to the blasting noise and vibration criteria relevant to the assessment of impacts on people and structures, the CEA Agency EIS Guideline also requires that the potential for blasting vibration impacts on fish behaviour such as spawning or migrations be considered. The *Guidelines for the Use of Explosives In or Near Canadian Fisheries Waters* provides information to proponents on the conservation and protection of fish, marine mammals and their habitat from the impacts of explosive use in or near water. Note that in this guideline, the term "fish" is defined to include "shellfish, crustaceans, marine animals and the eggs, sperm, spawn, spat and juvenile stages of fish, shellfish, crustaceans and marine animals".

The recommended underwater noise and vibration limits are as follows:

"No explosive is to be detonated in or near fish habitat that produces, or is likely to produce, an instantaneous pressure change (i.e., overpressure) greater than 100 kPa (14.5 psi) in the swimbladder of a fish."

and

"No explosive is to be detonated that produces, or is likely to produce, a peak particle velocity greater than $13 \text{ mm} \cdot \text{s}^{-1}$ in a spawning bed during the period of egg incubation."

In decibels, the 100 kPa underwater noise overpressure limit corresponds to 220 dB re 1 μ Pa.

The guideline provides indicative setback distances from the land-water interface for explosive use to comply with the target levels. In addition, no explosive is to be knowingly detonated within 500 m of any marine mammal.

3.0 NOISE AND VIBRATION PROPAGATION

3.1 Outdoor noise propagation

Outdoor sound propagation between a sound source and a receptor is affected by several sound attenuation and propagation mechanisms. These include dissipation with distance, ground attenuation, atmospheric attenuation, barrier attenuation (such as shielding by buildings or terrain), as well as meteorological effects such as wind and temperature gradients.

Ground cover in the study area is mainly forested. At the quarry site, open areas with exposed rock and crushed rock would become more predominant over the life of the quarry. The ground attenuation properties of forested areas are relatively sound-absorptive. The ground attenuation properties of areas of exposed rock and crushed rock are predominantly sound-reflective.

Wind effects on outdoor sound propagation can cause variations in the sound level of a distant facility. Similar effects are caused by temperature gradients in the atmosphere. The sound level variations caused by wind and temperature gradients are most pronounced for large source/receptor distances. Sound from a distant facility which propagates in a downwind direction (and/or during atmospheric inversion conditions) results in higher sound levels at a receptor than for calm conditions and a neutral atmosphere. This effect is caused by the downward refraction (or bending) of sound rays as they propagate through the atmosphere. Conversely, sound propagating in an upwind direction (and/or during lapse conditions in the atmosphere) is refracted upwards, which results in lower sound levels at the receptor. Sound propagating in a crosswind direction does not exhibit refraction effects and is essentially the same as sound propagation during calm conditions and a neutral atmosphere. This noise assessment assumes atmospheric conditions which produce moderate downward refraction of sound. This condition results in relatively efficient outdoor sound propagation between a source and receptor, and is representative of adverse noise impact effects associated with meteorological factors.

3.2 Underwater Noise Propagation

Underwater noise propagation is also affected by various attenuation and propagation mechanisms. The resulting level at any particular location removed from the source is the result of geometric spreading of the signal, combined with any losses or attenuations. Losses can be due to volume attenuation, to the conversion of acoustic energy to heat, to scattering, as well as losses due to interactions with the seafloor and surface (although a water surface is typically a very efficient reflector of sound, especially when the surface is smooth). Sound propagation underwater is also highly dependent on the speed of sound, which varies as a function of water temperature, ocean salinity and depth.

If all losses due to factors other than geometric spreading are neglected, then the transmission loss (TL) at a distance R from the noise source would be wholly due to spherical spreading (in deep water) or cylindrical spreading (in the case of shallow water, bounded above and below).

Spherical spreading means underwater noise would attenuate by 6 dB with each doubling of distance. Cylindrical spreading means an attenuation of 3 dB with each doubling of distance.

In terms of underwater noise, bodies of water up to 200 m deep are considered to be “shallow”. In shallow water, noise propagation is highly dependent on the properties of the bottom and the surface as well as the properties of the fluid. The following points are relevant to the prediction of noise propagation in shallow water¹:

- The properties of the water are reasonably constant with depth. In particular, the speed of sound may be assumed to be constant (although it may vary seasonally with water temperature).
- Sources of transmission loss other than cylindrical spreading are dominated by bottom interaction effects (absorption) at lower frequencies (< 1 kHz) and by scattering losses at high frequencies.
- There is a low-frequency cut-off, below which energy is transferred directly into the sea floor.
- There is an optimum transmission frequency which is dependent on the water depth.
- Parameters such as depth and the bottom properties can vary with range.

3.3 Vibration Propagation

Vibration (both on land and underwater) propagates through the ground mass and to a large extent is unaffected by external factors such as topography and weather or water conditions. Key factors in the propagation and attenuation of ground vibration are the distance from the source (for example the blast point or excavation equipment), and site-specific elements such as rock or seabed type, geology and thickness of ground layers.

4.0 EXISTING NOISE AND VIBRATION LEVELS

4.1 Baseline Noise Monitoring Survey

Baseline sound monitoring surveys were completed by AECOM over 48 hours in November 2011 at the two residential dwellings nearest the property boundary:

- Location 1: 950 m west of the Project property boundary and 1.65 km west of the proposed quarry. The monitoring station was installed near the house trailer (currently uninhabited) at the eastern extremity of Half Island Cove Road; and
- Location 2: 870 m south of the property boundary and 920 m south of the proposed quarry. The station was installed at the entrance to Eagle Valley Road, just off Route 16.

The equipment used for the ambient noise surveys was two 2900 integrating/logging sound level meters (unit version 02.4, serial numbers CDF060006 and CDE020012). The meters were

¹ Jensen, F.B., W.A. Kuperman, M.B. Porter, H.Schmidt (2000). Computational Ocean Acoustics Springer-Verlag, New York.

calibrated prior to the study commencing. The monitoring took place over 48 hours in total with a logging interval of one hour.

At Location 1 to the west of the project site near the coast, the dominant noise sources noted were waves, birds, and the movement of leaves. At Location 2 the predominant noise source noted was traffic passing along the road.

The noise readings were recorded in A-weighted decibels (dBA) and reported in three categories (see Appendix A for definitions of noise parameters):

1. as equivalent continuous noise level (L_{eq}),
2. as the noise level exceeded for 10% of the time (L_{10}), which is used to give an indication of the upper limit of fluctuating noise, such as that from road traffic; and
3. as the noise level exceeded 90% of the time (L_{90}). This last parameter is generally taken to be the ambient or background noise level.

At both stations, measurements were collected over 1-hour intervals. This data has been collated to report results over each of the three time periods designated in the Guidelines: daytime (7am to 7pm), evening (7pm to 11pm), and night-time (11pm to 7am). Time periods corresponding to wind speeds greater than 20 km/h or periods of precipitation have not been included in the summary analysis. The results are summarised in Table 4-1. The measurement data is also attached as Appendix B.

Table 4-1
Measured Ambient Noise Levels

Location	Time Period	Sound Level (dBA)		
		L_{eq}	L_{90}	L_{10}
Location #1 Half Island Cove Road	Daytime (7am to 7pm)	38.3	27.1	43.2
	Evening (7pm to 11pm)	31.7	28.9	34.4
	Night-time (11pm to 7am)	33.1	28.2	37.0
Location #2 Eagle Valley Road	Daytime (7am to 7pm)	51.0	24.2	56.3
	Evening (7pm to 11pm)	48.9	25.8	53.9
	Night-time (11pm to 7am)	42.1	24.3	35.8

The monitoring survey results in Table 4-1 indicate a noise environment with very low existing background noise levels, as is expected for a remote rural environment. The L_{90} background levels are lower at Location 2 (which is inland) than at Location 1 (nearer the coast). However the L_{eq} (or average) noise levels were typically higher at Location 2, probably due to the influence of road traffic noise at this location.

The background noise levels at both locations are similar during the daytime, evening and night-time periods.

4.2 Comments on Baseline Vibration

Ambient vibration levels in the study area have not been measured. Since this is a rural/remote location with no existing anthropogenic vibration sources nearby, existing ambient ground vibration levels are expected to be low, below the thresholds of human perception.

4.3 Comments on Baseline Underwater Noise and Vibration

Ambient underwater noise and vibration levels in the study area have not been measured. While there are no existing localised anthropogenic sources of underwater noise and vibration, underwater noise can propagate over very large distances. For this reason, both natural and anthropogenic sources may contribute to the existing environment in the project area.

Natural underwater noise sources include wind, waves, precipitation, sea ice, marine fauna, and seismic background activity. Anthropogenic noise sources include shipping, seismic exploration activity, sonar equipment, construction and industrial activity, and explosive detonations. Whether natural or anthropogenic sources dominate at any particular time and location depends on changing natural conditions, and the proximity and level of the human activities. This assessment focuses on the identification of the underwater noise and vibration impacts of the Project, and does not consider the varying influence of the ambient environment on overall underwater noise or vibration levels.

5.0 CONSTRUCTION NOISE AND VIBRATION

The relevant guidelines do not include specific requirements for the assessment of noise and vibration during construction. Since construction activities would occur predominantly within the quarry operation and processing areas, and the construction activities are anticipated to generate noise at levels similar to or less than noise from quarry operations, it is assumed that the noise and vibration impacts during construction would generally be similar to or less than impacts during operation.

One possible exception to this is that the number of heavy vehicles accessing the quarry site by road may be higher during some periods of construction than during operations. It is anticipated that trucks would be used for the final stage of transport of equipment onto the site. Increased heavy vehicle noise on local roads may be noticeable at times during construction.

Where possible, heavy vehicles would be scheduled to arrive and depart the construction site during daytime hours to minimise potential noise impacts at locations near the site road access.

6.0 UNDERWATER CONSTRUCTION NOISE AND VIBRATION

6.1 Overview of Marine Terminal Construction

The preferred construction method for the marine terminal employs a fill and rock technique along the shore. The fill and rock material will be sourced from the site. Blasting in the terrestrial near shore area for construction of the laydown area and approach to the wharf may also be required. Underwater blasting is not expected to be required.

Construction of the marine terminal will also require construction of caissons, piers/dolphins, a rubble approach and finally the slewing rail and shiploader.

The direct underwater construction noise and vibration impacts would be temporary and restricted to the immediate construction area. The activity with the greatest potential for underwater impacts is piling to support the piers and dolphins. These piles will be installed to anchor in the bedrock, from a barge using pile driving hammers and churn drills. Any piles required for the loadout conveyor in the nearshore area will be installed from land and at low tide.

6.2 Piling Underwater Noise Source Levels

Piling activities may give a wide range of possible noise source levels depending on the equipment used. Typically, pile driving sounds underwater are characterised by multiple rapid increases and decreases in sound pressure over time lasting approximately 300 to 500 ms. Most pile driving acoustic energy is relatively low frequency (< 2000 Hz).

SLR Consulting has conducted underwater noise measurements during pile driving for the construction of ship berths for previous projects. On the basis of these measurements, an indicative peak source noise level for piling of 230 dB re. 1 µPa at 1m is assumed for this assessment.

6.3 Piling Underwater Noise Impacts

The *Guidelines for the Use of Explosives In or Near Canadian Fisheries Waters* recommend a peak underwater overpressure of 100 kPa. While this limit is defined to manage blasting impacts, it may also be used as an indication of the extent of impacts due to piling. The overpressure limit of 100 kPa corresponds to 220 dB re 1 µPa, and represents a theoretical lethal level. In practice, the susceptibility of different types and sizes of fish to injury due to underwater noise can vary considerably. For this reason, this assessment is intended only to give an order of magnitude indication of the potential range of impacts.

On the basis of the assumed piling source noise level, it is estimated that the 100 kPa overpressure level may be exceeded in an area around the pile location extending up to 10m from the pile (conservatively assuming cylindrical spreading, and neglecting all other losses).

It is concluded that the direct impacts of piling on fish (including shellfish and crustaceans) are likely to be restricted to an area with indicative radius up to 10 m around each pile. Behavioural modification would be expected to occur at greater distances, during underwater piling activities.

7.0 OPERATIONAL NOISE IMPACT ASSESSMENT

7.1 Operational Noise Modelling Overview

The quarry will remove material from the pit which will increase in size throughout the life of the quarry, as illustrated in Figure 2. This assessment considers the future operation of the quarry, in a scenario when all equipment is operating at the maximum anticipated capacity and the pit is expanded to its maximum size. This situation represents a “worst-case” scenario for noise impacts.

The quarry would be operational 24 hours a day in the future scenario, with a production schedule of 16 hours and a maintenance schedule of 8 hours. Shipping of material produced could occur at any time of the day or night. It is assumed for the purpose of this assessment that all potential production and shipping noise sources are operational during the daytime and evening time periods, i.e. from 7:00 am to 11:00 pm. During the night-time, it is assumed that the majority of noise sources would shut down, with the exception of conveyors from stockpiles out to the ship-loading equipment, and some mobile plant in the maintenance area.

While shiploading may take place at any time, it is estimated that that approximately 100 ships will be loaded per year once the plant reaches peak production. Since it will take approximately

18 to 24 hours to load the largest ships, noise impacts due to shiploading at night-time would be expected on less than a third of all nights.

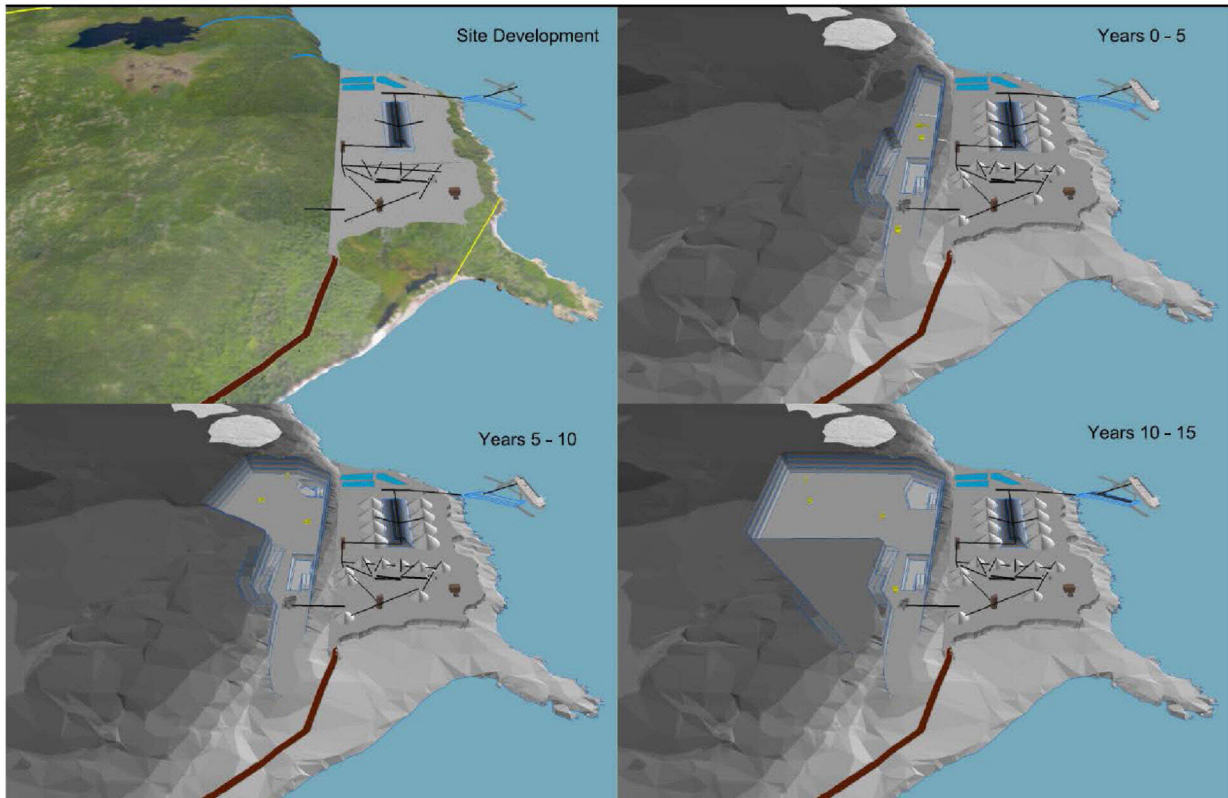

Figure 2
Simplified quarry development over time

7.2 Noise Modelling Procedure

In order to calculate the noise emission levels at the site boundary and at residential receiver locations, a SoundPLAN (Version 7.2) environmental computer model was developed. SoundPLAN is a software package which enables compilation of a sophisticated computer model comprising a digitised ground map (containing ground contours and buildings), the location and acoustic sound power levels of potentially critical noise sources on site and the location of receivers for assessment purposes.

The computer model can generate noise emission levels taking into account such factors as the source sound power levels and locations, distance attenuation, ground absorption, air absorption and shielding attenuation, as well as meteorological conditions, including wind effects.

The computer noise models utilize the ISO 9613-1² calculation method for absorption of sound by the atmosphere, and the CONCAWE³ calculation method for outdoor sound propagation from industrial facilities.

Meteorological parameters and ground attenuation values typical of summer seasonal conditions are used in the noise model calculations. Predicted sound levels were calculated for a temperature of 10°C, a relative humidity of 70%, and downwind sound propagation from source to receptor based on a wind speed of 7.5 km/hr. Hard ground was assumed across the Project site and over the ocean, with soft ground elsewhere. The computer model calculations also take into account the topography of the study area, which was imported into the modelling software in the form of digital elevation data.

The noise model results presented in this report include only the effects of industrial noise in the study area; they do not include the effects of non-industrial ambient noise, such as road traffic, or natural sounds.

7.3 Quarry Noise Sources

Table 7-1 summarises the equipment that is expected to be operating on the site in the future scenario, along with the source sound power levels assumed for this study. The layout of the equipment including elevations is shown in Appendix C.

Equipment sound power levels have been derived from SLR Consulting's experience of the unmitigated noise emissions of equipment in similar applications. The source levels assumed are therefore considered to be conservative. There is potential to mitigate the noise emissions of equipment during the detail design of the Project to minimise noise impacts.

7.5 Discussion of Operational Noise Impacts

The predicted worst case daytime operational noise impacts at residential receivers (Table 7-3) indicate that the Project is expected to comply with of the *Guidelines for Environmental Noise Measurement and Assessment*. This guideline defines noise limits being:

- $L_{eq} \leq 65$ dBA between 0700 to 1900 hours (daytime)

- $L_{eq} \leq 60$ dBA between 1900 to 2300 hours (evening)
- $L_{eq} \leq 55$ dBA between 2300 to 0700 hours (night-time, Sunday and statutory holidays)

The *NSE Pit and Quarry Guidelines* also define noise limits identical to the daytime, evening and night-time limits above, but require that the limits be observed at the property boundaries of the pit or quarry. The predicted worst case noise impacts at the site boundary (see Table 7-2) indicate that the Project has the potential to exceed the noise limits at the property boundary in an unmitigated future operating scenario. Industry standard mitigation measures are described in Section 7.6.

7.5.1 Daytime and Evening Noise Impacts on Residences

For the purpose of this assessment, the daytime and evening noise emissions are assumed to be the same. The predicted noise levels at the nearest residential receivers during the daytime and evening range from 47 dBA to 55 dBA, complying with the most stringent noise limit of 55 dBA. These predicted noise impacts represent a worst-case scenario, once the quarry is fully developed, and with no noise mitigation measures included in the detailed design. At the commencement of quarry construction and operation, noise levels would be expected to be considerably less than indicated in this assessment.

The dominant noise sources during daytime operations would be the crushers and screen towers.

While compliance with the numeric noise limits at residences is expected, the noise of the quarry will be noticeable at residences during the daytime and evening, particularly during otherwise quiet periods. Quarry production noise is generally characterised by low-frequency “rumbling” noise that does not vary much with time. At the levels predicted in this assessment, it is anticipated that in future noise from the quarry would dominate the background noise environment in the local area during the daytime and evening periods, and will be audible at a “moderate to quiet” level in nearby residential areas (see Appendix A for more information on perception of noise levels).

7.5.2 Night-time Noise Impacts on Residences

The predicted noise levels at the nearest residential receivers during night-time shiploading and site maintenance activities range from 25 dBA to 41 dBA, complying with the night-time limit of 55 dBA. These predicted noise impacts represent a worst-case scenario on nights when shiploading takes place, and with no noise mitigation measures included in the detailed design. Shiploading is expected to occur on around 100 nights per year once operations reach full capacity.

The dominant noise sources during night-time shiploading and maintenance operations would be the conveyors leading out to the ship.

While compliance with the numeric night-time noise limits at residences is expected, the noise impact of night-time shiploading will be noticeable at residences. At the levels predicted in this assessment, it is anticipated that in future noise from night-time shiploading would contribute to the background noise environment in the local area, and will be audible at a “quiet” level in nearby residential areas (see Appendix A for more information on perception of noise levels). The character of night-time noise would be a steady low-frequency “rumbling” noise. The night-time noise level would not be expected to disturb the sleep of most people.

7.5.3 Noise Impacts at Project Boundary

The predicted noise levels around the project boundary indicate there is potential for exceedances of the noise goals at the project boundary both during daytime operations and during night-time shiploading and site maintenance activities. These predicted noise impacts represent a worst-case scenario with no noise mitigation measures included in the detailed design. The highest noise levels are predicted at the boundary on the coast both to the east and to the west of the site – this is because these project boundaries are closest to the dominant production equipment noise sources, and do not benefit from as much shielding by the terrain as the areas south of the site.

7.6 Operational Noise Mitigation

There is opportunity to reduce the noise impacts below the levels identified in this report by design and implementation of noise mitigation measures. Design-related mitigation measures included in the model are having the majority of mobile equipment operating in the pit below ground surface, and retaining natural barriers such as hillsides to the extent possible. Product stockpiles would also be located to block noise transmission – this benefit has not been modelled since the height of stockpiles would be variable. Additional reasonable and feasible mitigation options include the specification of best practice equipment noise emissions during the procurement stage, and/or the incorporation of equipment enclosures or other noise shielding such as localised walls or earth mounds for noisy equipment items. For example, for conveyor systems it is anticipated that noise emissions 5-10 dB lower than assumed in this assessment could be achieved by specification of low noise conveyor systems⁴.

The staged development of the quarry means that there is scope to monitor noise emissions as the quarry develops, and to include additional noise mitigation in the later stages if required to comply with the noise limits at the site boundary.

8.0 BLASTING NOISE AND VIBRATION IMPACT ASSESSMENT

Blasting will occur anywhere from 30 to 200 days per year, depending on aggregate sales demand. Blasting locations will be based on pit geometry and will vary over the life of the quarry. Face heights will range from 13 m to 20 m with an average height of approximately 15 m. The average number of holes in an individual blast will be approximately 60 but this number would vary in a range from 20 to 100. Shot patterns will be staggered or square and typically placed in no more than four rows. Holes would be spaced approximately 3 m to 5 m apart. Typical charge weights (kg per delay) per hole will be approximately 270 kg but may range from less than 25 kg (during plant construction) to 400 kg.

The minimum distance to nearest off-site structure will be greater than 800 m, complying with the NSE *Pit and Quarry Guidelines* minimum distance. Initial blasts at the commencement of quarrying operations would take place at much greater offset distances, with the nearest sensitive receivers more than 1500 m from the blast location.

⁴ Brown, S.C. *Conveyor Noise Specification and Control*. Proceedings of Acoustics 2004, Gold Coast, Australia, pp269-275.

On the basis of this nominated indicative blast design, the level of blast noise (overpressure) and vibration emissions can be predicted using standard formulae and assuming blasting in average rock.

8.1 Blasting Overpressure

The relevant formula for airblast overpressure is:

$$P = K_a \left(\frac{R}{Q^{1/3}} \right)^A$$

Equation 1

Where,

- P = pressure (kPa)
K_a, A = constants related to site specific propagation
R = distance between charge and receiver (m)
Q = Charge mass per delay (kg)

For the purpose of this assessment, the site exponent A is assumed to be -1.45, which corresponds to an attenuation rate of 8.6 dB with doubling of distance. For confined blasthole charges, the site constant K_a is commonly in the range 10 to 100. The resulting estimates of blasting overpressure levels for the maximum anticipated charge mass per delay are presented in Table 8-1.

**Table 8-1
Estimated Blasting Overpressure Levels at Maximum Charge Mass per Delay**

Receiver Distance (m)	Overpressure Level (dB)	
	Q=550 kg, K _a =10	Q=550 kg, K _a =100
900	115	135
1000	113	133
1500	108	128
2000	105	125

Equation 1 is a generic equation, and in practice the site specific constants may vary considerably, as indicated by the 20 dB range of estimated overpressure levels in Table 8-1 for the range of likely values of K_a. Factors that affect the site specific propagation include the pit geometry, the blast location relative to the receiver, the amount of shielding provided by terrain and meteorological conditions. In unfavourable meteorological conditions, it is common for airblast levels to be increased by up to 20 dB due to the combined effects of temperature inversions and/or wind velocity. Alternatively, airblast levels would be reduced from the levels estimated in Table 8-1 at blast locations where shielding is provided by the pit geometry or surrounding terrain.

Table 8-1 indicates that compliance with the airblast overpressure limit of 128 dB is expected at sensitive receiver locations at the commencement of quarry operations, for the potential range of site propagation constants considered in this assessment (including the most conservative assumptions).

At the minimum blast distances anticipated to occur as the pit expands, it is possible the airblast overpressure limit of 128 dB may be exceeded, depending on blast location relative to the receiver, site specific propagation factors and meteorological conditions. However, the layout of the Project site and indicative pit geometry indicates that the potentially affected receivers would benefit from shielding due to pit geometry. For this reason, it is considered that exceedance of the airblast overpressure limit at sensitive receivers is unlikely throughout the life of the quarry. Furthermore, there is scope to mitigate the potential impacts further if required by adjusting the individual blast designs and considering meteorological conditions.

As required by the NSE *Pit and Quarry Guidelines*, all blasts would be monitored to establish overpressure levels. This monitoring would be used to develop site-specific propagation constants, to enable refinement of the blast overpressure predictions as the quarry develops. In this manner, blast designs can be adopted that comply with the overpressure limits at sensitive receivers throughout the life of the quarry.

8.2 Blasting Vibration

The relevant formula for the prediction of blasting ground vibration is:

$$V = K_b \left(\frac{R}{Q^{1/2}} \right)^{-B}$$

Equation 2

Where,

- V = ground vibration as vector peak particle velocity (mm/s)
- K_b , B = constants related to site and rock properties for estimation purposes
- R = distance between charge and receiver (m)
- Q = Charge mass per delay (kg)

As many site factors will affect the transmission of vibration through the ground, the following levels are considered to be estimates, based on blasting in average rock to a free face under average field conditions. The estimates are of mean vibration level (50% exceedance level). The corresponding assumed site constants are K_b of 1140, and B of 1.6. The resulting mean estimated ground vibration levels are shown in Table 8-2. In practice, due to variations in ground conditions and other factors, the resulting ground vibration levels can vary from two-fifths to four times that estimated in Table 8-2.

Table 8-2
Estimated Mean Blasting Ground Vibration at Maximum Charge Mass per Delay

Receiver Distance (m)	Vibration (mm/s)
900	3.3
1000	2.8
1500	1.5
2000	0.9

Table 8-2 indicates that compliance with the vibration limit of 12.5 mm/s is likely at all sensitive receiver locations both at the commencement of quarry operations and throughout the life of the quarry.

As required by the NSE *Pit and Quarry Guidelines*, all blasts would be monitored to establish vibration levels. This monitoring would be used to develop site-specific propagation constants, to enable refinement of the blast vibration predictions as the quarry develops. In this manner, blast designs can be refined as required to comply with the vibration limits at sensitive receivers throughout the life of the quarry.

8.3 Blasting Noise and Vibration Mitigation Measures

The NSE Pit and Quarry Guidelines Section VIII. Blasting describes control measures for blasting noise and vibration. These measures are reproduced as follows:

- (1)(b) *No person shall fail to monitor all blasts for the parameters outlined in VIII(1)(a).*
- (2) *Monitoring results shall be forwarded to the Department on a monthly basis unless otherwise indicated.*
- (3) *No blasting shall occur on Sunday, on a statutory holiday prescribed by the Province, or on any day between the hours of 1800 hours and 0800 hours.*
- (4) *Every person responsible for the operation of a quarry shall have a technical blast design prepared by a qualified person which ensures the ground vibration and air concussion outlined in VIII (1) can be achieved.*
- (5) *Every person responsible for the operation of a quarry shall conduct a preblast survey of all structures within 800 m of the point of blast. This survey should be conducted with Nova Scotia Environment and Labour's "Procedure For Conducting a Pre-Blast Survey".*
- (6) *No blasting is to take place if a thermal inversion is anticipated at the time of the proposed blast.*

9.0 BLASTING NOISE AND VIBRATION UNDERWATER IMPACT ASSESSMENT

While underwater blasting is not anticipated to be required by the Project, the location of the quarry adjacent to the ocean means that there is potential for quarry blasting noise and vibration to impact on the underwater environment and marine fauna.

Indicative offset distances between a blast and the ocean to meet the 13 mm/s underwater vibration limit in a spawning bed may be estimated using the same formula applied to terrestrial vibration impacts in Section 8.2 (Equation 2). The *Guidelines for the Use of Explosives In or Near Canadian Fisheries Waters* indicates that the offset distance required to meet the underwater noise overpressure guideline level of 100 kPa is typically one third of the distance required to meet the vibration limit in spawning beds, for blasting in rock.

As with the terrestrial vibration assessment, the underwater vibration predictions are based on mean vibration levels. In practice, variations in ground conditions and other factors mean that vibration and the resulting underwater noise level can vary considerably. For the purpose of this assessment, the recommended offset distances between a blast point and ocean habitats are

presented as a range. The range presented in Table 9-1 corresponds to the estimated mean or typical offset distance, and the estimated maximum offset distance (assuming a maximum vibration level four times higher than the mean or typical value). This factor of four has been included in the estimates because ground vibration levels in practice can vary from two-fifths to four times the estimated mean value (Angel 2006).

Table 9-1
Approximate Blasting Setback Distances to Ocean Habitats by Charge Mass

	Charge Mass per delay (kg)				
	50kg	100kg	200 kg	300 kg	400 kg
Setback distance for vibration impacts to spawning beds (m)	120-280	170-390	240-560	290-680	330-780
Setback distance for underwater noise impacts to fish (m)	40-90	60-130	80-190	100-230	110-260

It is recommended that these setback distances be refined following monitoring of initial test blasts at the site (using small charge weights). Depending on their proximity to ocean habitats, these initial blasts may need to take place outside of any identified spawning periods for marine fauna. These initial blasts would identify the site-specific vibration transmission characteristics, to enable design of blasts to comply with the underwater noise and vibration limits.

10.0 CONCLUSION

The potential noise and vibration impacts of the Project have been assessed in accordance with the requirements of the Canadian Environmental Assessment Agency (CEA Agency) and Nova Scotia Environment (NSE). As required by the relevant guidelines for the EIS, the assessment identifies the current ambient noise and vibration levels within the local area, summarises the results of a baseline ambient noise survey, and provides information on typical sound sources, geographic extent and temporal variations. The noise and vibration impacts of the Project have also been identified, and recommendations made for mitigation of noise impacts during future aggregate production.

ATTACHMENT A
Acoustic Terminology

Black Point Quarry Project
Guysborough County, NS
SLR Project No.: 210.05913.00000

1 Sound Level or Noise Level

The terms "sound" and "noise" are almost interchangeable, except that in common usage "noise" is often used to refer to unwanted sound.

Sound (or noise) consists of minute fluctuations in atmospheric pressure capable of evoking the sense of hearing. The human ear responds to changes in sound pressure over a very wide range. The loudest sound pressure to which the human ear responds is ten million times greater than the softest. The decibel (abbreviated as dB) scale reduces this ratio to a more manageable size by the use of logarithms.

The symbols SPL, L or LP are commonly used to represent Sound Pressure Level. The symbol LA represents A-weighted Sound Pressure Level. The standard reference unit for Sound Pressure Levels expressed in decibels is 2×10^{-5} Pa.

2 "A" Weighted Sound Pressure Level

The overall level of a sound is usually expressed in terms of dBA, which is measured using a sound level meter with an "A-weighting" filter. This is an electronic filter having a frequency response corresponding approximately to that of human hearing.

People's hearing is most sensitive to sounds at mid frequencies (500 Hz to 4000 Hz), and less sensitive at lower and higher frequencies. Thus, the level of a sound in dBA is a good measure of the loudness of that sound. Different sources having the same dBA level generally sound about equally loud.

A change of 1 dBA or 2 dBA in the level of a sound is difficult for most people to detect, whilst a 3 dBA to 5 dBA change corresponds to a small but noticeable change in loudness. A 10 dBA change corresponds to an approximate doubling or halving in loudness. The table below lists examples of typical noise levels.

Sound Pressure Level (dBA)	Typical Source	Subjective Evaluation
130	Threshold of pain	Intolerable
120	Heavy rock concert	Extremely noisy
110	Grinding on steel	
100	Loud car horn at 3 m	Very noisy
90	Construction site with pneumatic hammering	
80	Kerbside of busy street	Loud
70	Loud radio or television	
60	Department store	Moderate to quiet
50	General Office	
40	Inside private office	Quiet to very quiet
30	Inside bedroom	
20	Recording studio	Almost silent

Other weightings (eg B, C and D) are less commonly used than A-weighting. Sound Levels measured without any weighting are referred to as "linear", and the units are expressed as dB(lin) or dB.

3 Sound Power Level

The Sound Power of a source is the rate at which it emits acoustic energy. As with Sound Pressure Levels, Sound Power Levels are expressed in decibel units (dB or dBA), but may be identified by the symbols SWL or Lw, or by the reference unit 10^{-12} W.

The relationship between Sound Power and Sound Pressure may be likened to an electric radiator, which is characterised by a power rating, but has an effect on the surrounding environment that can be measured in terms of a different parameter, temperature.

4 Statistical Noise Levels

Sounds that vary in level over time, such as road traffic noise and most community noise, are commonly described in terms of the statistical exceedance levels LAN, where LAN is the A-weighted sound pressure level exceeded for N% of a given measurement period. For example, the LA1 is the noise level exceeded for 1% of the time, LA10 the noise exceeded for 10% of the time, and so on.

The following figure presents a hypothetical 15 minute noise survey, illustrating various common statistical indices of interest.

Of particular relevance, are:

- LA1 The noise level exceeded for 1% of the 15 minute interval.
- LA10 The noise level exceeded for 10% of the 15 minute interval. This is commonly referred to as the average maximum noise level.
- LA90 The noise level exceeded for 90% of the sample period. This noise level is described as the average minimum background sound level (in the absence of the source under consideration), or simply the background level.
- LAeq The A-weighted equivalent noise level (basically the average noise level). It is defined as the steady sound level that contains the same amount of acoustical energy as the corresponding time-varying sound.

When dealing with long term statistical noise data, it is sometimes necessary to define the typical noise levels at a given monitoring location for a particular time of day. A standardised method is available for determining these representative levels.

This method produces a level representing the "repeatable minimum" LA90 noise level over the daytime, evening and night-time measurement periods. In addition the method produces mean or "average" levels representative of the other descriptors (LAeq, LA10, etc).

5 Tonality

Tonal noise contains one or more prominent tones (ie distinct frequency components), and is normally regarded as more offensive than "broad band" noise.

6 Impulsiveness

An impulsive noise is characterised by one or more short sharp peaks in the time domain, such as occurs during hammering.

7 Frequency Analysis

Frequency analysis is the process used to examine the tones (or frequency components) which make up the overall noise or vibration signal. This analysis was traditionally carried out using analogue electronic filters, but is now normally carried out using Fast Fourier Transform (FFT) analysers.

The units for frequency are Hertz (Hz), which represent the number of cycles per second.

Frequency analysis can be in:

- Octave bands (where the centre frequency and width of each band is double the previous band)
- 1/3 octave bands (3 bands in each octave band)
- Narrow band (where the spectrum is divided into 400 or more bands of equal width)

The following figure shows a 1/3 octave band frequency analysis where the noise is dominated by the 200 Hz band. Note that the indicated level of each individual band is less than the overall level, which is the logarithmic sum of the bands.

8 Vibration

Vibration may be defined as cyclic or transient motion. This motion can be measured in terms of its displacement, velocity or acceleration. Most assessments of human response to vibration or the risk of damage to buildings use measurements of vibration velocity. These may be expressed in terms of "peak" velocity or "rms" velocity.

The former is the maximum instantaneous velocity, without any averaging, and is sometimes referred to as "peak particle velocity", or PPV. The latter incorporates "root mean squared" averaging over some defined time period.

Vibration measurements may be carried out in a single axis or alternatively as triaxial measurements. Where triaxial measurements are used, the axes are commonly designated vertical, longitudinal (aligned toward the source) and transverse.

The common units for velocity are millimetres per second (mm/s). As with noise, decibel units can also be used, in which case the reference level should always be stated. A vibration level V , expressed in mm/s can be converted to decibels by the formula $20 \log (V/V_0)$, where V_0 is the reference level (10^{-9} m/s). Care is required in this regard, as other reference levels may be used by some organizations.

9 Human Perception of Vibration

People are able to "feel" vibration at levels lower than those required to cause even superficial damage to the most susceptible classes of building (even though they may not be disturbed by the motion). An individual's perception of motion or response to vibration depends very strongly on previous experience and expectations, and on other connotations associated with the perceived source of the vibration. For example, the vibration that a person responds to as "normal" in a car, bus or train is considerably higher than what is perceived as "normal" in a shop, office or dwelling.

10 Over-Pressure

The term "over-pressure" is used to describe the air pressure pulse emitted during blasting or similar events. The peak level of an event is normally measured using a microphone in the same manner as linear noise (ie unweighted), at frequencies both in and below the audible range.

11 Ground-borne Noise, Structure-borne Noise and Regenerated Noise

Noise that propagates through a structure as vibration and is radiated by vibrating wall and floor surfaces is termed "structure-borne noise", "ground-borne noise" or "regenerated noise". This noise originates as vibration and propagates between the source and receiver through the ground and/or building structural elements, rather than through the air.

Typical sources of ground-borne or structure-borne noise include tunnelling works, underground railways, excavation plant (eg rockbreakers), and building services plant (eg fans, compressors and generators).

The following figure presents the various paths by which vibration and ground-borne noise may be transmitted between a source and receiver for construction activities occurring within a tunnel.

The term "regenerated noise" is also used in other instances where energy is converted to noise away from the primary source. One example would be a fan blowing air through a discharge grill. The fan is the energy source and primary noise source. Additional noise may be created by the aerodynamic effect of the discharge grill in the airstream. This secondary noise is referred to as regenerated noise.

1.0 INTRODUCTION AND BACKGROUND

Vulcan Materials Company and Morien Resources Corp. (the Proponent) proposes the development, operation, decommissioning and abandonment of a granite quarry and marine terminal at Black Point in Guysborough County, Nova Scotia. The Black Point Quarry Project consists of aggregate production (drilling, blasting, processing and stockpiling) on a 354.5 ha property, along with the construction and operation of a 200 m long marine terminal adjacent to the quarry in Chedabucto Bay. The aggregate will be loaded into bulk carriers up to 70,000 DWT and transported to ports along the US eastern and Gulf coasts and potentially to markets in Canada and the Caribbean.

The Black Point Quarry Project (the Project) is located on the south shore of Chedabucto Bay in the District of Guysborough, Nova Scotia. The proposed Project Site is approximately 2 and 2.5 km from the communities of Half Island Cove in the west, and Fox Island Main in the east, respectively. The Project is situated between Highway 16 and the Atlantic coast in an area dominated by coniferous forests, coastal barrens, as well as various types of wetlands, including bog, fen, swamp and marsh. A power transmission line corridor runs along the south end of the property and with the exception of a few ATV trails, skidder tracks and property cut lines, the area is relatively undisturbed. The Project Site is depicted in Figure 1-1.

This summary report presents the results of ecological field survey conducted in 2010 and in 2014. The 2010 surveys were completed by AMEC Earth & Environmental (AMEC) and presented in report format in February 2011 (Black Point Baseline Ecological Surveys Summary Report). The AMEC work was conducted for Erdene Resource Development Corp. (Erdene), the initial proponent of the Project. Subsequently, the Project was taken over by Vulcan Materials Company and Morien Resources Corp. who retained AMEC to update the ecological information through field surveys in 2014. This report builds on the 2011 Summary Report in that additional and new field information is simply added or inserted where applicable. The updated information is identified as 2014 survey results. It is of note that the status information provided for species recorded in 2010 and reported in 2011 has not been updated.

The results presented in this report derive from on-site surveys for:

- Vascular Plants;
- Cyanolichens;
- Birds, including
 - Owls and early breeders;
 - Migrating and early breeding passerines
 - Breeding passerines;
 - Shorebirds and coastal birds;
- Mammals;
- Herpetiles (reptiles and amphibians);

- Odonates (dragonflies and damselflies);
- Wetlands;
- Freshwater habitat and fish communities;
- Marine habitat and benthic invertebrate communities.

The full wetland delineations were beyond the scope of the AMEC surveys conducted in 2010. They were conducted in the 2011 and 2014, following the finalization of the Project design, and are reported in a separate document.

2.0 FLORA

2.1 VASCULAR PLANTS

Field surveys were carried out in order to describe the existing plant communities and habitats within the Project Site, identify wetlands, and to confirm presence or absence of rare plants. These surveys were also supplemented during the 2014 wetland and vegetation surveys.

2.1.1 Approach and Methodology

In preparation for the vascular plant field surveys, maps of existing habitat were assembled, indicating streams, wetlands and habitats including forest types. Map sources included available mapping from provincial and federal governments, such as aerial photography, the NSDNR Wetlands Database (NSDNR 2000), Forest Inventory Mapping (NSDNR 2010), and 1:50,000 topographic maps (11F/06) (NRCan 1998).

A priority species list was prepared prior to conducting field work in order to help guide the plant surveys by identifying plant species at risk /conservation concern potentially present on the site. In order to prepare this priority list an ACCDC data search was obtained in April 2010 (ACCDC 2010) to identify any plant species at risk/conservation concern previously identified within 100 km radius of the site.

For the purpose of the vascular plant surveys, the survey area consisted of all land encompassed within the property boundary provided by Erdene (Figure 1-1). Surveys within the Project Site focused on habitats suitable for potential vascular plant species at risk. Habitats with high potential for species at risk include freshwater and marine wetlands, as well as floodplains of streams and rivers. Forest habitats, except forests in flood plains, are estimated to have medium to low potential for rare vascular plants. Surveys for rare vascular plants were timed to cover both early and late phenology. Field surveys in the Project Area were carried out between June 22 and June 25, 2010 (early summer); and between August 31 and September 8, 2010 (late summer). A third round of surveys was conducted between August 18 and August 22, 2014 to update and supplement the 2010 surveys.

The surveys were carried out by senior botanist Dr. Marion Sensen and biologist Scott Burley. All habitat types in the Project Site were surveyed. Streams visible on the topographic maps as well as streams identified during the field surveys were investigated. Floodplains and aquatic flora of streams and lakes were also surveyed. All wetlands within the Project Area were investigated, including any wetlands which were field identified during the surveys, but which are not included in the provincial Wetlands Inventory Database (NSDNR 2000).

An inventory of plant species present on the Project Site was established in order to describe the existing habitat. Samples of species which were difficult to identify in the field were collected and later identified in the laboratory using a microscope and applicable identification guides. Photographs were taken of all major habitat types encountered during the survey.

2.1.2 Baseline Inventory

Five main habitat types were encountered within the Project Site. Most of the Project Site is covered by a mosaic of barren vegetation and coniferous forest. There are also patches of mixed forest, and wetlands such as treed bog, open bog, fen, and swamp scattered throughout the Project Area.

Coniferous Forest

Patches of coniferous forest dominated by balsam fir (*Abies balsamea*), and black spruce (*Picea mariana*) are present throughout the Project Site. The understory of this habitat type varies in dominant species but can include lambkill (*Kalmia angustifolia*), late low blueberry (*Vaccinium angustifolium*), twinflower (*Linnaea borealis*), bunchberry (*Cornus canadensis*), starflower (*Trientalis borealis*), and wild sarsaparilla (*Aralia nudicaulis*).

Photo 2-1. Coniferous Forest Patch

Photo 2-2. Balsam Fir Dominated Coniferous Forest

Barren

Much of the Project Site is dominated by low barren vegetation. This habitat type can either be dominated by shrub species such as huckleberry (*Gaylussacia baccata*), late low blueberry and common juniper (*Juniperus communis*) growing to heights of less than one metre. Other forms of this habitat type are dominated by black crowberry mats growing over rocks. This type of barren is typically located closer to the coast (on headlands), but can occur inland over bedrock outcrops.

Photo 2-3. Low Barren/Shrub Barren Transition Area

Photo 2-4. Coastal Headland Barren

Photo 2-5. Low Barren

Tall Shrub Barren

A number of tall shrub barren vegetation patches are located throughout the Project Site. Dominant vegetation in these areas include Pin Cherry (*Prunus pensylvanica*), Alder (*Alnus incana*), and Mountain Holly (*Nemopanthes mucronatus*). In many instances, this habitat type acts as a transition zone between coniferous forest and barren habitat (described above).

Photo 2-6. Tall Shrub Barren

Mixed Forest

Mixed forest patches are scattered throughout the Project Site. These areas are dominated by canopy species such as red maple (*Acer rubrum*), heart-leaved paper birch (*Betula papyrifera* var. *cordifolia*), balsam fir, and understory species including lambkill, late low blueberry, twinflower, bunchberry, starflower and wild sarsaparilla (*Aralia nudicaulis*). This habitat type is generally located in the southern end of the Project Site but does occur in patches closer to the coast.

Photo 2-7. Mixed Forest along Stream

Wetlands

A number of wetlands were identified within the Project Site. Wetland types encountered within the Project Site include open/treed bogs, fens, and treed/shrub swamps. Wetlands surveyed within the Project Area are described in more detail below in Section 4 and in the 2014 Wetland Baseline Survey Report.

Other habitat types

A number of other habitat types were also encountered within the Project Site including beaches, coastal barren headlands, coastal cliffs, regenerating forests, and lakes. Three mapped streams, as well as a number of intermittent/seasonal drainage channels, are also located on the property. Freshwater habitats on the site are discussed in Section 5.

A complete inventory of the vascular plant species observed during the surveys is provided in Table A.1-1 in Appendix A.1.

Photo 2-8. Beach at Northeast End of Property

2.1.3 Species of Conservation Concern

One vascular plant species of conservation concern was detected on the Project Site during the June 2010 surveys. Southern twayblade (*Listera australis*) has an ACCDC rarity rank of S2. This species was encountered along two streams located within the Project Area. Figure 2-1 illustrates the locations where this species was encountered. One location contained over 40 individuals within a relatively small area whereas only one individual was found at the second location. This species is shown in Photo 2-9, while its habitat is depicted in Photo 2-10.

An additional plant species of conservation concern, Northern Comandra (*Geocaulon lividum* – ACCDC rank S3) was detected during the August 2014 field survey. This species was noted in Wetland 18 (WL18) in the open bog portion of this wetland. Numerous individuals were reported throughout this wetland. Figure 2-1 illustrates the locations where this species was encountered. This species is shown in 11, while its habitat is depicted in Photo 2-101.

Photo 2-11. *Geocaulon lividum* in open bog

Photo 2-12. *Geocaulon lividum* habitat

No plant species at risk listed by SARA/COSEWIC or in the *Nova Scotia Endangered Species Act (NSESA)* were identified in the field during the two vegetation surveys (June 2010 and August/September 2010).

2.2 LICHENS

2.2.1 Approach and Methodology

Field survey for lichens focused on cyanolichens. These lichens contain a blue-green algae (cyanobacterium) instead of (or in addition to) a green alga, as the photosynthetic component. Cyanolichens are very sensitive to air quality (Richardson, 1988), and are the only group of lichens which have been given status rankings by the Nova Scotia Department of Natural Resources (NSDNR General Status Ranks of Wild Species, 2010). Field surveys for cyanolichens were conducted by traversing through and around the proposed Project Site, visiting all habitat types. An AMEC lichenologist examined all potential substrates, such as tree trunks, branches, soil, and rock and recorded all cyanolichen species observed. Particular attention was paid to potential suitable habitat for cyanolichen species of concern, such as shaded, humid locations and mature red maples (*Acer rubrum*) growing in and around wetlands.

Mature balsam fir (*Abies balsamea*) trees on north-facing slopes were also examined, as such trees may support the boreal felt lichen (*Erioderma pedicellatum*). This species is an epiphytic cyanolichen listed as endangered under both the SARA and the NSESA. It is red-listed by NSDNR. The boreal felt lichen predictive habitat mapping maintained by Nova Scotia

Environment (Robert Cameron, NSE, pers. comm. April, 2010) was consulted to determine if there was any potential boreal felt lichen habitat on the site which would warrant further investigation. The mapping indicated there are no areas of potential habitat for this species on the site.

Examples of additional lichen (non-cyanolichen) species detected during field surveys for other taxa in 2010 were also recorded.

2.2.2 Baseline Inventory

A total of 9 species of cyanolichen were detected during the field survey. Table 2.1 lists the cyanolichen species observed on the Project Site during field surveys in 2010.

Table 2.1 Cyanolichen Species Identified on the Proposed Black Point Project Site in 2010

Binomial	Common Name	ACCDC Subnational Rank	NSDNR General Status
<i>Lobaria pulmonaria</i>	--	S4S5	Green
<i>Lobaria quercizans</i>	--	S4S5	Green
<i>Lobaria scrobiculata</i>	--	S4S5	Green
<i>Peltigera canina</i>	Dog Lichen	S4S5	Green
<i>Peltigera leucophlebia</i>	Dog's Tooth Lichen	S4S5	Yellow
<i>Pseudocyphellaria perpetua</i>	---	S4S5	Green
<i>Collema sp.</i>	--	--	--
<i>Leptogium sp.</i>	--	--	--
<i>Nephroma sp.</i>	--	--	--

Several additional non-cyanolichen species were observed during the cyanolichen and other taxa surveys in 2010, these are listed in Table 2.2. None of these species have been assigned status ranks by NSDNR.

Table 2.2. Other Lichen Species Identified on the Proposed Black Point Project Site in 2010.

Binomial	Common Name	ACCDC Subnational Rank
<i>Cladonia arbuscula</i>	Bering Reindeer Lichen	S4S5
<i>Cladonia multiformis</i>	--	S4S5
<i>Cladonia rangiferina</i>	Reindeer Lichen	S4S5
<i>Cladonia maxima</i>	Reindeer Lichen	S4S5
<i>Cladonia sp.</i>	---	--
<i>Arctoparmelia centrifuga</i>	Concentric-ring Lichen	S4S5
<i>Parmelia squarrosa</i>	--	S4S5
<i>Ramalina thrausta</i>	--	S2S3
<i>Platismatia glauca</i>	--	S4S5
<i>Xanthoria parietina</i>	Maritime sunburst lichen	S4S5
<i>Usnea spp. *</i>	Old Man's Beard Lichen	-

*Note that *Usnea* species are notoriously difficult to identify to species, often requiring the use of thin-layer chromatography.

2.2.3 Species of Conservation Concern

A single cyanolichen species of concern was detected on the Site during the surveys in 2010. A specimen of *Peltigera leucophlebia* was detected at the location depicted on Figure 2-1. This

species was yellow-listed by NSDNR, indicating it is vulnerable to natural or anthropogenic events. ACCDC ranks this species as S4S5. According to the updated General Status ranks (2010), this species is now ranked as 4 and is no longer considered rare.

No boreal felt lichen was detected on the Site, nor was any habitat deemed to be particularly suitable.

A second uncommon lichen (though not a cyanolichen), *Ramalina thrausta*, was found on the Site. The approximate location is depicted on Figure 2-1. ACCDC ranks this species as S2S3.

2.2.4 Species of Conservation Concern (2014)

Due to changes in species ranks and legislative requirements, an additional round of rare lichen surveys was carried out in August 2014. During these field surveys three additional lichen species of conservation concern were recorded on the Site. *Ramalina thrausta* (Angelhair Ramalina Lichen), detected in 2010, is still considered a species of conservation concern, with General Status rank 3. Table 2.3 provides a summary of the additional lichen species of conservation concern recorded in the Black Point Study Area. It should be noted that in wetlands with suitable habitat, *Cladonia stygia* occurred frequently enough that only examples of *C. stygia* patches were marked with GPS locations.

Table 2.3. Lichen SOCC Identified on the Proposed Black Point Project Site in 2014.

Binomial	Common Name	ACCDC Rank	General Status Rank*	Location	Habitat
<i>Cladonia stygia</i>	Black-footed Reindeer Lichen	S2S3	3	WL 9, WL11, WL18, WL19, WL20	Open Bog

3.0 FAUNA

3.1 BIRDS

3.1.1 Approach and Methodology

Bird surveys were carried out at those times of the year when birds make the most intensive use of the area. Survey times were chosen based on known breeding and migration periods, and all habitats used by the targeted birds were surveyed at appropriate times of the year to maximize the quality and quantity of data obtained. Surveys were conducted at the time of day with the highest likelihood of detecting the target species (e.g., early morning for breeding passerines, and during the appropriate parts of the tidal cycle for shorebirds), and in favourable conditions to maximize detection probability (low winds, no precipitation).

Survey dates and primary targets were as follows:

April 14th, 2010: year-round residents and early breeders, including owls;

May 18th and 19th, 2010: main passerine migration and early breeders;

June 22nd and 23rd, 2010: main passerine breeding;

August 25th, 2010: early shorebird migration; and

September 23rd, 2010: late shorebird migration.

Bird species, abundance and geographical location were recorded during each of the site visits. The location of each survey point was recorded using a handheld GPS unit. The early breeding bird survey in April included a night-time survey for owls which used the playback method employed by the Atlantic Canada Nocturnal Owl Survey (BSC, 2011). At each survey location, a series of owl calls interspersed with listening periods was played, for a total listening time of 15 minutes. Locations are depicted on Figure 3-1. For the day-time surveys in April, formal point counts were not conducted (as most birds were not yet present and/or vocalizing); instead, a list of observed species was recorded as the surveyors traversed the Project Site.

For the May and June surveys, ten-minute Maritimes Breeding Bird Atlas (MBBA)-style point counts were conducted at 29 fixed locations within the Project Site including each of the available habitat types on the Site. Points were selected in a systematic manner, with point counts spaced approximately 300 m apart in an effort to cover the entire project footprint; after the habitat classification had been completed, point count locations were plotted on a habitat figure (Figure 3-1) to ensure that all habitat types were represented in the surveys.

Surveys began at approximately 0600 hrs, and although efforts were made to complete the point counts by 1000 hrs, i.e., within four hours of dawn, because of time constraints the surveys often continued until late morning or very early afternoon in order to obtain data from each of the point count locations. It is very important to note that the point counts conducted after 1000 hrs are likely to miss many species that are present in the area but that do not tend to sing beyond the early morning hours; for that reason, the data from the late morning/early afternoon point counts are presented separately in the summary tables and are considered qualified. The point count surveys employed silent listening only; no playback was used. During each point count, species were identified visually or by their characteristic songs and call

notes, and the observer recorded numbers of each species observed as well as breeding evidence using Bird Studies Canada and Maritimes Breeding Bird Atlas criteria. Surveys were conducted only during suitable weather conditions, with no precipitation or winds that would interfere with listening conditions.

In addition to the point counts, Fogherty Lake was viewed from the bank (near PC-03 and PC-04) to look for shorebirds and waterfowl, and the waters off the coast were scanned for the presence of marine-associated bird species (seabirds, waterfowl and shorebirds). Any incidental observations of birds or other fauna made while traversing the site between point count locations were noted.

Shorebird data were collected in August and September according to the Atlantic Canada Shorebird Survey protocol (CWS, 2003). Surveyors walked back and forth along suitable areas of coastline within the Project Site (Figure 3-1) several times throughout the tidal cycle, recording numbers and species of shorebirds seen on each pass. In addition, a list of observed species was recorded as the surveyors traversed the Project Site, and the waters off the coast were scanned for the presence of seabirds and waterfowl.

3.1.2 Baseline Inventory

Owls and Early Migrants

During the nocturnal survey on April 14, 2010, three owl survey locations were established (Figure 3-1). At Survey Location PC03, near the southwest corner of the Site, two owls were heard: Northern Saw-whet Owl (*Aegolius acadicus*) and Barred Owl (*Strix varia*). No owls were heard at the other two owl survey locations.

A total of nineteen species were encountered during the day-time bird surveys in April. Table 3.1 lists these species, along with their NSDNR status and ACCDC ranks, respectively.

Table 3.1. Bird Species Identified During Daytime Surveys on Black Point Project Site, April 2010.

Common Name	Binomial	NSDNR Status	ACCDC rank
American Black Duck	<i>Anas rubripes</i>	Green	S5
American Crow	<i>Corvus brachyrhynchos</i>	Green	S5
Bald Eagle	<i>Haliaeetus leucocephalus</i>	Green	S4
Black-capped Chickadee	<i>Poecile atricapilla</i>	Green	S5
Boreal Chickadee	<i>Poecile hudsonica</i>	Yellow	S3
Brown Creeper	<i>Certhia americana</i>	Green	S5
Common Loon	<i>Gavia immer</i>	Yellow	S3B,S4N
Common Raven	<i>Corvus corax</i>	Green	S5
Dark-eyed Junco	<i>Junco hyemalis</i>	Green	S4S5
Golden-crowned Kinglet	<i>Regulus satrapa</i>	Green	S4
Great Black-backed Gull	<i>Larus marinus</i>	Green	S4
Hairy Woodpecker	<i>Picoides villosus</i>	Green	S5
Herring Gull	<i>Larus argentatus</i>	Green	S4S5
Merlin	<i>Falco columbarius</i>	Green	S5B
Northern Flicker	<i>Colaptes auratus</i>	Green	S5B
Pileated Woodpecker	<i>Dryocopus pileatus</i>	Green	S5
Red-breasted Merganser	<i>Mergus serrator</i>	Green	S3B,S5N
Ruffed Grouse	<i>Bonasa umbellus</i>	Green	S4S5
Song Sparrow	<i>Melospiza melodia</i>	Green	S5B

May and June Point Count Surveys

Twenty-nine point counts were conducted during the May and June surveys using the methodology described in Section 3.1.1; of those, 22 were surveyed in the early morning (between dawn and 1000 hrs), while seven were conducted after 1000 hrs. The locations of the point count surveys are depicted on Figure 3-1, and the habitat type(s) within an approximately 100m radius of each point count are described in Table 3.2. Tables B.1-1 and B.1-2 (Appendix B) summarize the observations at each point count location. The seven point counts conducted after 1000 hrs, in both May and June, had a lower number of species detected per point count than did the early morning point counts, with a notable drop in numbers of many early morning singers (e.g. most sparrow and warbler species), and an overrepresentation of species that are frequently observed and/or vocal throughout the day (e.g. Black-capped and Boreal

Chickadees, Ruby-crowned Kinglet, Blue-headed Vireo, Winter Wren). It is of note that **all habitat types were surveyed with at least one point count before 10:00 am** (Table 3-2).

Table 3.2. Habitat Types of Point Count Locations on Black Point Project Site, May and June 2010.

Habitat Type(s)	Point Count ID(s) ¹
Coniferous Forest	5,7,13,14,19,20,21,23,26
Barrens	9,11,12
Wetland (bog, fen, treed swamp)	3,29
Regenerating Forest	1,24
Mixed (Barrens and Wetland)	18,2
Mixed (Coniferous Forest and Barrens)	8,10,15,16,17,22,25,27,28
Mixed (Coniferous Forest and Regenerating Forest)	6

Note: Point counts 12, 13, 14, 26, 27, 28 and 29 were surveyed after 1000 hrs

May Migrant and Early Breeding Bird Survey

Point counts were conducted over two days (May 18 and 19) by AMEC ornithologists. A total of 407 birds, representing forty-one species were observed or heard during the May migration and early breeding surveys (Table B.1-1 in Appendix B). An average of 15.1 ± 4.0 (standard deviation) individual birds were recorded per point count, excluding the counts conducted after 1000 hrs; in the late morning/early afternoon point counts, 10.7 ± 3.9 individuals were recorded. Bird species of concern are discussed in Section 3.1.2.

June Breeding Birds

On June 22 and 23 2010, point count surveys were conducted by AMEC ornithologists at the same twenty-nine locations as in May (Figure 3-1). A total of 240 birds, representing forty-six species, were detected during the June breeding bird surveys (Table B.1-2 in Appendix B). An average of 13.4 ± 3.9 individual birds were recorded per point count, excluding the counts conducted after 1000 hrs; in the late morning/early afternoon point counts, 10.3 ± 4.9 individuals were recorded. Bird species of concern are discussed in Section 3.1.2.

Shorebirds

During the August 25 and September 23 surveys, five shorebird species were observed in small numbers feeding on the shores of the study area (Table 3.3).

Table 3.3. Shorebird Species Observed on Shoreline of Black Point Project Site in 2010.

Species	Binomial	NSDNR Status	ACCDC Rank	Number Observed	
				Aug. 25	Sept. 23
Greater Yellowlegs	<i>Tringa melanoleuca</i>	Green	S3B,S5M	3	0
Semipalmated Sandpiper	<i>Calidris pusilla</i>	Green	S3M	4	0
Spotted Sandpiper	<i>Actitis macularius</i>	Green	S3S4B	4	0
Least Sandpiper	<i>Calidris minutilla</i>	Green	S1B,S5M	9	0
Semipalmated Plover	<i>Charadrius semipalmatus</i>	Green	S1S2B,S5M	10	4

Four seabird species, Northern Gannet (*Morus bassanus*), Herring Gull (*Larus argentatus*), Great Black-backed Gull (*L. marinus*) and Double-crested Cormorant (*Phalacrocorax auritus*) were observed feeding, flying, and/or resting on the water during the surveys. In addition, 20 landbird species were also observed on the Project Site during the fall surveys (Table 3.4).

Table 3.4. Additional Bird Species Identified During Fall Shorebird Surveys on Black Point Project Site in 2010.

Common Name	Binomial	NSDNR Status	ACCDC Rank
American Crow	<i>Corvus brachyrhynchos</i>	Green	S5
American Kestrel	<i>Falco sparverius</i>	Green	S5B
Bald Eagle	<i>Haliaeetus leucocephalus</i>	Green	S4
Belted Kingfisher	<i>Megaceryle alcyon</i>	Green	S5B
Black-capped Chickadee	<i>Poecile atricapilla</i>	Green	S5
Blue Jay	<i>Cyanocitta cristata</i>	Green	S5
Boreal Chickadee	<i>Poecile hudsonica</i>	Yellow	S3
Cedar Waxwing	<i>Bombycilla cedrorum</i>	Green	S5B
Common Raven	<i>Corvus corax</i>	Green	S5
Common Yellowthroat	<i>Geothlypis trichas</i>	Green	S5B
Dark-eyed Junco	<i>Junco hyemalis</i>	Green	S4S5
Golden-crowned Kinglet	<i>Regulus satrapa</i>	Green	S4
Hairy Woodpecker	<i>Picoides villosus</i>	Green	S5
Northern Flicker	<i>Colaptes auratus</i>	Green	S5B
Northern Harrier	<i>Circus cyaneus</i>	Green	S5B
Red-breasted Nuthatch	<i>Sitta canadensis</i>	Green	S4S5
Red-eyed Vireo	<i>Vireo olivaceus</i>	Green	S5B
Red-tailed Hawk	<i>Buteo jamaicensis</i>	Green	S5
Sharp-shinned Hawk	<i>Accipiter striatus</i>	Green	S4S5B
White-throated Sparrow	<i>Zonotrichia albicollis</i>	Green	S5B

3.1.3 Incidental Observations

Three additional species were observed on the Project Site or just offshore by AMEC staff in 2010, outside of the targeted bird surveys. These are listed in Table 3.5.

Table 3.5 Incidental Bird Observations on the Black Point Site, 2010.

Common Name	Binomial	NSDNR Status	ACCDC Rank
Common Eider	<i>Somateria mollissima</i>	Green	S4
Ruby-throated Hummingbird	<i>Archilochus colubris</i>	Green	S5B
Spruce Grouse	<i>Falcipennis canadensis</i>	Green	S5

A complete list of all bird species observed on the Black Point site or just offshore during the 2010 field season is provided in Table B.1-3 in Appendix B.

3.1.4 Bird Species of Conservation Concern

Bird Species at Risk are those listed under federal or provincial endangered species legislation, such as *SARA* or the *NSESA*. No bird species listed as rare or endangered under *SARA* or the *NSESA* were observed on the proposed Black Point Project Site.

Species of concern are those listed as Yellow (sensitive) or Red (at-risk) by NSDNR, or as S3 or lower (S2, S1) by ACCDC. Ten species of concern were documented on the Black Point Site by AMEC staff in 2010.

Four species listed by NSDNR as Yellow or sensitive to anthropogenic or natural events were found on the site (Table 3.6). Another six were listed as S3 or lower for some part of the population or life history (*i.e.* migration or breeding).

Table 3.6. Bird Species of Concern Identified on the Black Point Project Site in Fall 2010.

Common Name	Binomial	NSDNR Status	ACCDC Rank
Boreal Chickadee	<i>Poecile hudsonica</i>	Yellow	S3
Common Loon	<i>Gavia immer</i>	Yellow	S3B,S4N
Gray Jay	<i>Perisoreus canadensis</i>	Yellow	S3S4
Rusty Blackbird	<i>Euphagus carolinus</i>	Yellow	S2S3B
Greater Yellowlegs	<i>Tringa melanoleuca</i>	Green	S3B,S5M
Red-breasted Merganser	<i>Mergus serrator</i>	Green	S3B,S5N
Semipalmated Sandpiper	<i>Calidris pusilla</i>	Green	S3M
Spotted Sandpiper	<i>Actitis macularius</i>	Green	S3S4B
Least Sandpiper	<i>Calidris minutilla</i>	Green	S1B,S5M
Semipalmated Plover	<i>Charadrius semipalmatus</i>	Green	S1S2B,S5M

3.2 MAMMALS

3.2.1 Approach and Methodology

Mammal surveys were conducted simultaneously with surveys for other taxonomic groups and wetlands on the site throughout the 2010 (for specific dates, refer to Sections 2.1, 3.1, 4.1, 5.1, and 6.1). Any evidence of mammal species such as sightings, tracks, vocalizations, tufts of hair, scat, and skeletal remains was recorded.

3.2.2 Baseline Inventory

A list of terrestrial mammals determined to be utilizing habitats on the proposed Black Point project site is provided in Table 3.7.

Table 3.7. Mammal Species Identified on the Black Point Project Site in 2010.

Common Name	Binomial	NSDNR Status	ACCDC Rank	Evidence
Red Squirrel	<i>Tamiasciurus hudsonicus</i>	Green	S5	Sighting, vocalizations
Eastern Chipmunk	<i>Tamias striatus</i>	Green	S5	vocalizations

American Beaver	<i>Castor canadensis</i>	Green	S5	Dams, lodges
North American Porcupine	<i>Erethizon dorsatum</i>	Green	S5	Sighting
Eastern Coyote	<i>Canis latrans</i>	Green	S5	Scat, tracks
Black Bear	<i>Ursus americanus</i>	Green	S5	Sighting, scat
Short-tailed Weasel	<i>Mustela erminea</i>	Green	S5	Sighting
Varying Hare	<i>Lepus americanus</i>	Green	S5	Scat
White-tailed Deer	<i>Odocoileus virginianus</i>	Green	S5	Tracks, scat

Other mammals such as Bobcat (*Lynx rufus*), Raccoon (*Procyon lotor*), and Red Fox (*Vulpes vulpes*) may also be present. Small mammal species such as shrews, voles, and mice are assumed to be present.

Two species of marine mammals were observed off the site during field surveys in 2010, these were northern minke whale (*Balaenoptera acutorostrata*) and gray seal (*Halichoerus grypus*). Many other species of marine mammals are expected to occur in the vicinity of the study area.

3.3 HERPETILES

3.3.1 Approach and Methodology

During terrestrial and freshwater field surveys conducted on the Project site in 2010 (for specific dates, refer to Sections 2.1, 3.1, 4.1, 5.1, and 6.1), reptile and amphibian observations were recorded during surveys for other taxonomic groups. Any evidence of herpetile species, including sightings, vocalizations, cast skins (snakes), skeletal remains, egg masses or presence of larvae, was recorded. Ponds and watercourses and their banks were scanned using binoculars during the day to detect presence of turtles, either in the water or basking, night-time field work included listening for vocalizations of frogs and toads, and coarse woody debris such as fallen logs and branches was overturned to look for salamanders and newts.

3.3.2 Baseline Inventory

A list of herpetile species determined to be utilizing habitats on the proposed Black Point project site is provided in Table 3.8

Table 3.8 Herpetile Species Identified on the Black Point Project Site in 2010.

Common Name	Binomial	NSDNR Status	ACCDC Rank	Evidence
Yellow Spotted Salamander	<i>Ambystoma maculatum</i>	Green	S5	Sighting of larvae
American Toad	<i>Bufo americanus americanus</i>	Green	S5	Sighting of adults, vocalizations
Spring Peeper	<i>Pseudacaris crucifer crucifer</i>	Green	S5	Sighting of adults, vocalizations
Green Frog	<i>Rana clamitans melanota</i>	Green	S5	Sighting of adults, vocalizations
Maritime Garter Snake	<i>Thamnophis sirtalis</i>	Green	S5	Sighting
Northern Leopard Frog	<i>Rana pipiens</i>	Green	S5	Sighting
Bullfrog	<i>Rana catesbeiana</i>	Green	S5	Sighting of adults and larvae

3.4 ODONATES

Odonate (dragonflies and damselflies) were surveyed on the site in June and July 2010 by local odonate expert Paul Brunelle, assisted by AMEC staff. Additional specimens were collected during August and September 2010 by AMEC staff, and added to Brunelle's report. The complete odonate report, including details on the approach and methodology, is provided in Appendix B.2.

3.4.1 Odonate Species of Conservation Concern

A single odonate species of concern was observed during the 2010 field surveys.

The spot-winged glider (*Pantala hymenaea*) is a large dragonfly species which is migratory in northeastern North America (Brunelle, 2010). It is listed as Yellow by NSDNR Meaning it is sensitive to anthropogenic or natural impacts. Globally, the spot-winged glider is listed as G5, and sub-nationally as S5B. A specimen was observed near shallow bog pools in Wetland 12 (Figure 1 in Appendix B.2), engaging in mating behaviour. However, it is not known if such bog pools are suitable for larval development of the fast-growing larvae of this genus (Paul Brunelle, pers. comm 2010.) See the Odonate report in Appendix B.2 for further details.

4.0 WETLANDS

4.1 APPROACH AND METHODOLOGY

Prior to conducting on-site wetland surveys, AMEC conducted a desktop study to identify potential wetland locations within the Project Site, using available information such as the Nova Scotia Wetland Database (NSDNR 2000), Nova Scotia Wet Areas Mapping (NSDNR 2009), and topographic mapping (NRCAN 1998). Field surveys consisted of visiting all areas identified during the desktop study as known wetland locations as well as areas having the potential to contain wetlands. Areas identified as “dry” during the desktop study were also verified in the field to ensure there were no wetlands located in these areas.

Wetland field surveys were conducted between August 31 and September 8, 2010 in conjunction with the August/September 2010 vascular plant surveys by AMEC senior botanist Marion Sensen and AMEC wetland biologist Scott Burley. The investigated sites were field-referenced using Global Positioning System (GPS) and recent aerial photography.

4.1.1 Wetland Determination/Identification

AMEC staff utilized standard wetland criteria to identify wetlands. To be determined a wetland, a site must meet the following three criteria:

- A majority of dominant vegetation species are wetland associated species;
- Hydrologic conditions exist that result in periods of flooding, ponding, or saturation during the growing season; and
- Hydric soils are present.

These criteria are briefly discussed in the following paragraphs.

Vegetation

Hydrophytic vegetation is defined as the sum total of macrophytic plant life that occurs in areas where the frequency and duration of inundation or soil saturation produce permanent or periodically saturated soils of sufficient duration to exert a controlling influence on the plant species present (Environmental Laboratory, 1987). The definition of wetlands includes the phrase “sustains aquatic processes as indicated by the presence of hydric soils, hydrophytic vegetation and biological activities adapted to wet conditions.” Hydrophytic vegetation should be the dominant plant type and is characterized by the dominant plant species comprising the plant community (Environmental Laboratory, 1987). Accordingly, AMEC assessed dominance of hydrophytic vegetation in each wetland on the Project Site.

Soils

A hydric soil is defined as a soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (USDA-NRCS, 2007). Indicators that a hydric soil is present include soil color (gleyed soils and soils with bright mottles and/or low matrix chroma), aquic or preaquic moisture regime, reducing soil conditions, sulfidic material (odour), soils listed on the hydric soils list, iron and manganese

concretions, organic soils (histosols), histic epipedon, high organic content in surface layer in sandy soils, and organic streaking in sandy soils.

To determine soil characteristics in some wetlands, the AMEC team excavated a soil pit to a minimum depth of 30 cm or refusal within each wetland. The soil was then examined for hydric soil indicators. The matrix color and mottle color (if present) of the soil was determined using the Munsell Soil Color Chart.

Hydrology

Wetlands, by definition, either periodically or permanently have a water table at, near or above the land's surface or are saturated with water. To be classified as a wetland, a site should have at least one primary indicator or two secondary indicators of wetland hydrology. Primary indicators of wetland hydrology may include, but are not limited to: water marks, drift lines, sediment deposition, drainage patterns, visual observation of saturated soils, and visual observation of inundation. In addition to the primary indicators, there is a variety of secondary wetland hydrology indicators. Secondary indicators include, but are not limited to: oxidized root channels in the upper 12 inches, water-stained leaves, and local soil survey data. When no primary indicators of wetland hydrology are observed at a data point, two or more secondary indicators are required to confirm wetland hydrology. In accordance with this definition, the AMEC team recorded primary and/or secondary indicators within each wetland.

Although complete wetland delineations were beyond the scope of the current survey, in preparation of anticipated future wetland delineations, wetland determination sheets were completed for a portion (seven) of the 20 wetlands surveyed within the Project Area. Determination sheets for the remaining wetlands were planned to be completed during the wetland delineation component of the project. Completed wetland determination sheets for the seven wetlands are provided in Appendix C.1.

4.1.2 Biophysical Habitat Assessment

AMEC selected the methodology of the Canadian Wetland Classification System to identify wetland classes, forms and types (National Wetland Working Group, 1997). Wetland vegetation is the primary biological indicator of major ecological processes, their vitality, and its ability to support wildlife. Wetland vegetative abundance and diversity depend upon a range of factors including soil types and topography, but are most closely linked to the nature of the hydrologic regime (Glooschenko and Grondin, 1988). Plants most clearly illustrate the biological capability of the wetland. The nature and dynamics of the vegetative community ultimately define wetland habitat type and subsequent functional values of the site.

The field assessments were conducted during the August 2010 survey by a crew of two people, both with experience in wetland ecology, habitat identification, and functional assessment. Biophysical field investigations were conducted according to methods best defined in Dickinson (1994). Standardized wetland field data sheets were used to document the wetland information collected in the field, which includes information on vegetation assemblages, inundation, wildlife and disturbance.

4.1.3 Detailed Habitat Sketches

Detailed habitat sketches were prepared in the field for each wetland to document the wetland components (i.e., inflow, outflow, standing water, vegetation communities, *etc.*) (Appendix C.2).

4.2 BASELINE INVENTORY

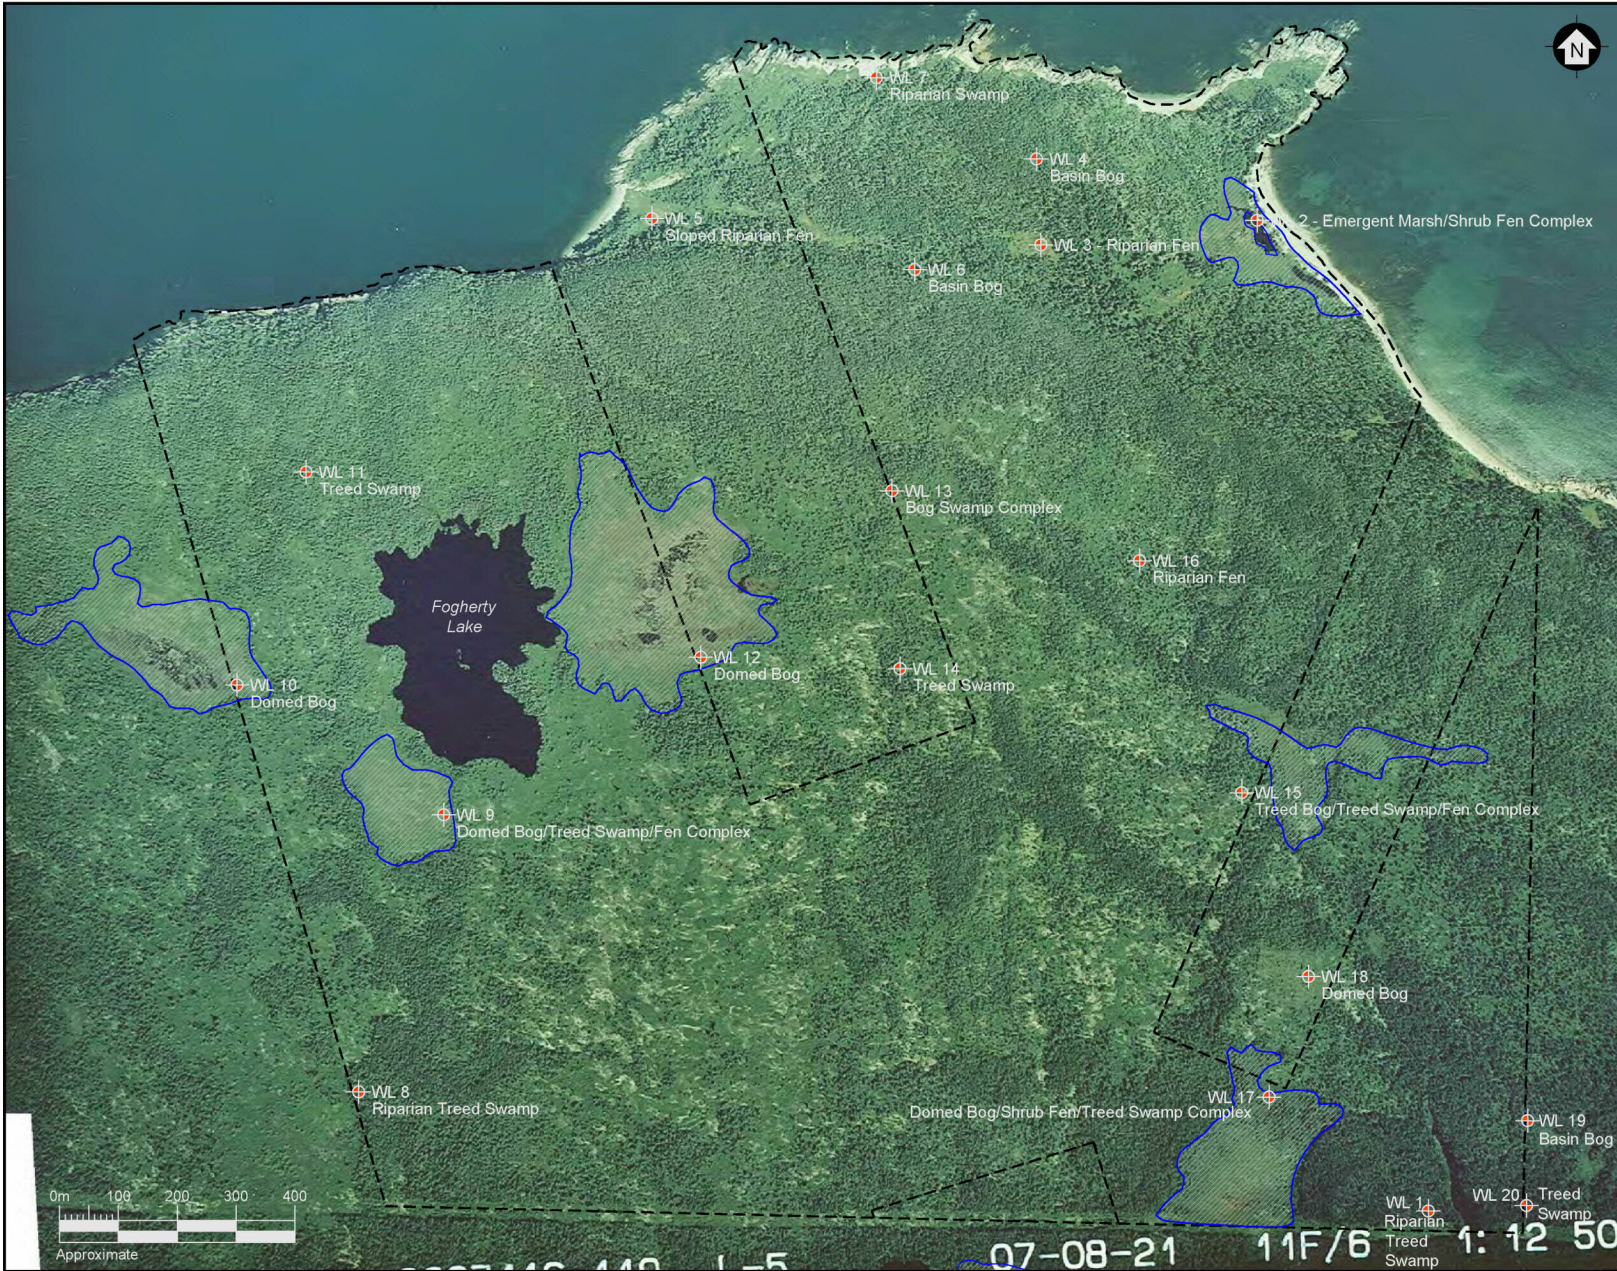

A total of 20 wetlands were surveyed within the Project Site (Table 4.1). This includes the six wetlands previously identified in the NSDNR Wetland Database as well as 14 additional field identified wetlands (Figure 4-1). Table 4.1 provides a summary of wetland types along with corresponding UTM coordinates and approximate areas for each wetland encountered within the Project Site. Wetland sizes reported are only estimates based on preliminary field observations and air photo interpretation, as complete wetland delineations were not conducted. A representative photo of each wetland is provided in Appendix C.3.

Table 4.1 Wetland Types and Locations Identified on the Black Point Project Site in 2010.

Wetland #	Wetland Type	Easting	Northing	Approximate Size (ha)

5.0 FRESHWATER HABITAT

5.1 APPROACH AND METHODOLOGY

Habitat assessment and fish community surveys were conducted on Fogherty Lake and three unnamed watercourses which were identified by field personnel with experience in fish habitat assessment methods. These freshwater habitats were identified using topographic mapping and aerial photography. Field work was conducted during two site visits, on August 24th to 26th and September 20th to 22nd, 2010. Locations of surveys are depicted on Figure 5-1.

Habitat Assessment

Physical dimensions and field-measured water quality parameters (pH, conductivity, water temperature and dissolved oxygen) of the lake and watercourses were noted. For each distinct habitat segment of the three watercourses, channel type, bank composition and stability, substrate composition and embeddedness, in-stream cover and overhanging vegetation was recorded. Locations were recorded using a hand-held Garmin GPS unit, and photographs were taken at representative sections of each water body. For the three watercourses, physical habitat characteristics along the surveyed sections of each watercourse were recorded on standard DNR&E/DFO New Brunswick Stream Survey and Habitat Assessment forms.

Water samples from each water body were collected in laboratory-supplied bottles and placed in a cooler with ice for shipping to AGAT Laboratories in Dartmouth, NS for analysis of general chemistry, total metals (including mercury), total suspended solids, and low-level phosphorous.

Fish Community Surveys

Fish sampling was conducted in Fogherty Lake and the three unnamed watercourses under a scientific permit (License # 323774) in accordance with the conditions outlined in Section 52 of the Fishery (General) Regulations (SOR/93-53) under the *Fisheries Act* (Government of Canada, 1985).

Five-minute spot checks were conducted on the watercourses with a backpack electrofishing unit, to determine presence or absence of fish species. Two multi-panel gillnets, with mesh sizes ranging from 2.5 cm to 10 cm, were deployed on Fogherty Lake for two hours on August 27, 2010. In addition, four minnow traps were baited with dry cat food and placed in shallow water near the shore of the lake for a total of four hours.

5.2 BASELINE INVENTORY

Habitat Assessment

A brief description of each of the water bodies assessed is provided below. The completed watercourse habitat assessment forms and Site photographs are provided in Appendices D.1 and D.2, respectively. Water quality data, including analytical results and field-measured parameters, are presented in Table D.3-1 in Appendix D.3. Surface water on the Project Site tended to be very acidic (pH<4).

Fogherty Lake

Fogherty Lake is a shallow lake surrounded by trees, barrens and exposed rock. The water is clear but darkly tea-coloured, and visibility is nil at approximately one metre depth. The lake substrate is exposed bedrock and large boulders. There is some woody organic debris on the lake bed, which has a strong sulfurous smell. Vegetation surrounding the lake includes leatherleaf (*Chaemodaphne calyculata*), sheep laurel (*Kalmia angustifolia*), possum-haw viburnum (*Viburnum nudum*), rhodora (*Rhododendron canadense*), chokeberry (*Photina* sp.) Labrador tea (*Ledum groenlandicum*), bunchberry (*Cornus canadensis*), black spruce (*Picea mariana*) and tamarack (*Larix laricina*). Yellow water lily (*Nuphar lutea*) was observed growing in the lake. Water in this lake was found to be very acidic (pH in field=2.94) and dark tea-coloured (Table D.3-1 in Appendix D.3).

Unnamed Watercourses

Unnamed Watercourse 1 is the outflow of Fogherty Lake to the north. A beaver dam is located near the upstream end of the watercourse. Upstream of the dam, the channel is deep and wide and the substrate largely fines; downstream, the channel is a relatively narrow and shallow run with one area of natural deadwater. The northernmost 150m of this watercourse was not surveyed, as it flows down a steep dropoff; however, the dimensions and substrate of the downstream reaches appeared to be similar to the run portions of the channel.

Unnamed Watercourse 2 originates in a steep valley at the north of the Project Site, and flows in a northwesterly direction. There was a great deal of deadfall in the channel valley. The upstream reaches were dry at the time of the survey, and further downstream the stream was very shallow; this watercourse is probably ephemeral. The last 220 m of this watercourse was inaccessible, as it flows down a steep slope to the ocean, as does Unnamed Watercourse 1. However, the dimensions and substrate of the downstream reaches appeared to be similar to the rest of the channel.

Unnamed Watercourse 3 originates in the southeast portion of the Project Site, flows through softwood forest and fen habitat, and ultimately discharges into Hendsbee Lake, south of the Project Site. The downstream portion of the assessed section is a large pool resulting from a beaver dam on the watercourse just south of the Site property line.

Fish Community Surveys

No fish were seen in Fogherty Lake, although a few insect species were found in and around the minnow traps, namely dragonflies, damselfies, mayflies, whirligig beetles, caddisfly larvae, and giant water bugs.

Five minute electrofishing spot-checks were conducted on Unnamed Watercourses 1 and 3, Unnamed Watercourse 2 was too shallow to fish. No fish were observed in either watercourse during the electrofishing and habitat assessments. Other AMEC field personnel reported seeing a small unidentified fish approximately 2 cm in length in Unnamed Watercourse 3. Based on habitat limitations, it is unlikely that this was a juvenile salmonid; the pH values measured at the Site range from 2.9 to 3.5, and fish passage to the ocean is impossible due to the steep terrain at the north of the Site.

A fourth ephemeral watercourse was identified on the Project Site near the western property boundary. This watercourse appears to drain Wetlands 8 and 9 when water levels are high. It was not surveyed, as it was well away from the proposed Project footprint. A spot check showed the water pH to be 2.65, too acidic to support fish.

In summary, neither Fogherty Lake nor any of the unnamed watercourses represent fish habitat due to acidic conditions.

6.0 MARINE HABITAT

Three types of marine surveys were conducted on the proposed marine footprint of the Project. This includes a benthic habitat survey, a marine invertebrate community survey, and a marine sediment survey.

6.1 UNDERWATER BENTHIC HABITAT SURVEY

6.1.1 Approach and Methodology

Between August 31 and September 3, 2010, video survey techniques were used to map substrate types and document macrofaunal and macrofloral species presence and abundance in the footprint of the proposed marine infrastructure. AMEC contracted Connors Diving Services to perform the diving and video surveillance activities. An AMEC representative was on-site to guide the dive crew in the event that any issues arose.

A total of 1,200 metres (m) of video surveillance divided into six transects (T1, T2, T3, T4, T5, and T6) was conducted in and around the marine portion of the Project Site, as depicted in Figure 6-1. T1, T2, and T3 each measured 250m and were oriented parallel to the shoreline while T4, T5, and T6 each measured 150m in length and extended perpendicular from the shoreline. The transect locations were visually referenced in the field and coordinates were derived using a handheld Global Positioning System (GPS) to mark the start and end points of the transects. These coordinates are also provided in Figure 6-1.

The underwater surveillance of the transects required the use of an underwater video camera, operated by a Canadian Standards Association (CSA)-certified diver using SCUBA. As much as was practical, the underwater video surveillance encompassed a span of approximately 1m on either side of the transect line. Seabed characterization involved field observations made by the field crew and a review of the video surveillance tape. Observations along the video transect were made for every 5m segment.

6.1.2 Baseline Inventory

The results of the transect surveys for the proposed Project Site are presented in Appendix E.1 (Tables E1-1 to E.1-6). The following information is provided for each 5m increment of transect line:

- Visual estimate of substrate grain size distribution (in order of dominance);
- Identification and abundance of macrofaunal species; and
- Identification and percent coverage of macrofloral species.

A summary of the information provided in Tables E.1-1 to E.1-6 (Appendix E.1) is described in the following paragraphs. A species list has been included in Table E.1-7 in Appendix E.1.

For the purposes of the video survey review and species assessment, four categories were developed to characterize the observed abundances. The categories are as follows:

A = Abundant

Numerous (not quantifiable) observations made throughout the entire 5m segment.

C = Common

Numerous (not quantifiable) observations made intermittently along the 5m segment.

O = Occasional

Quantifiable observations made intermittently along the 5m segment.

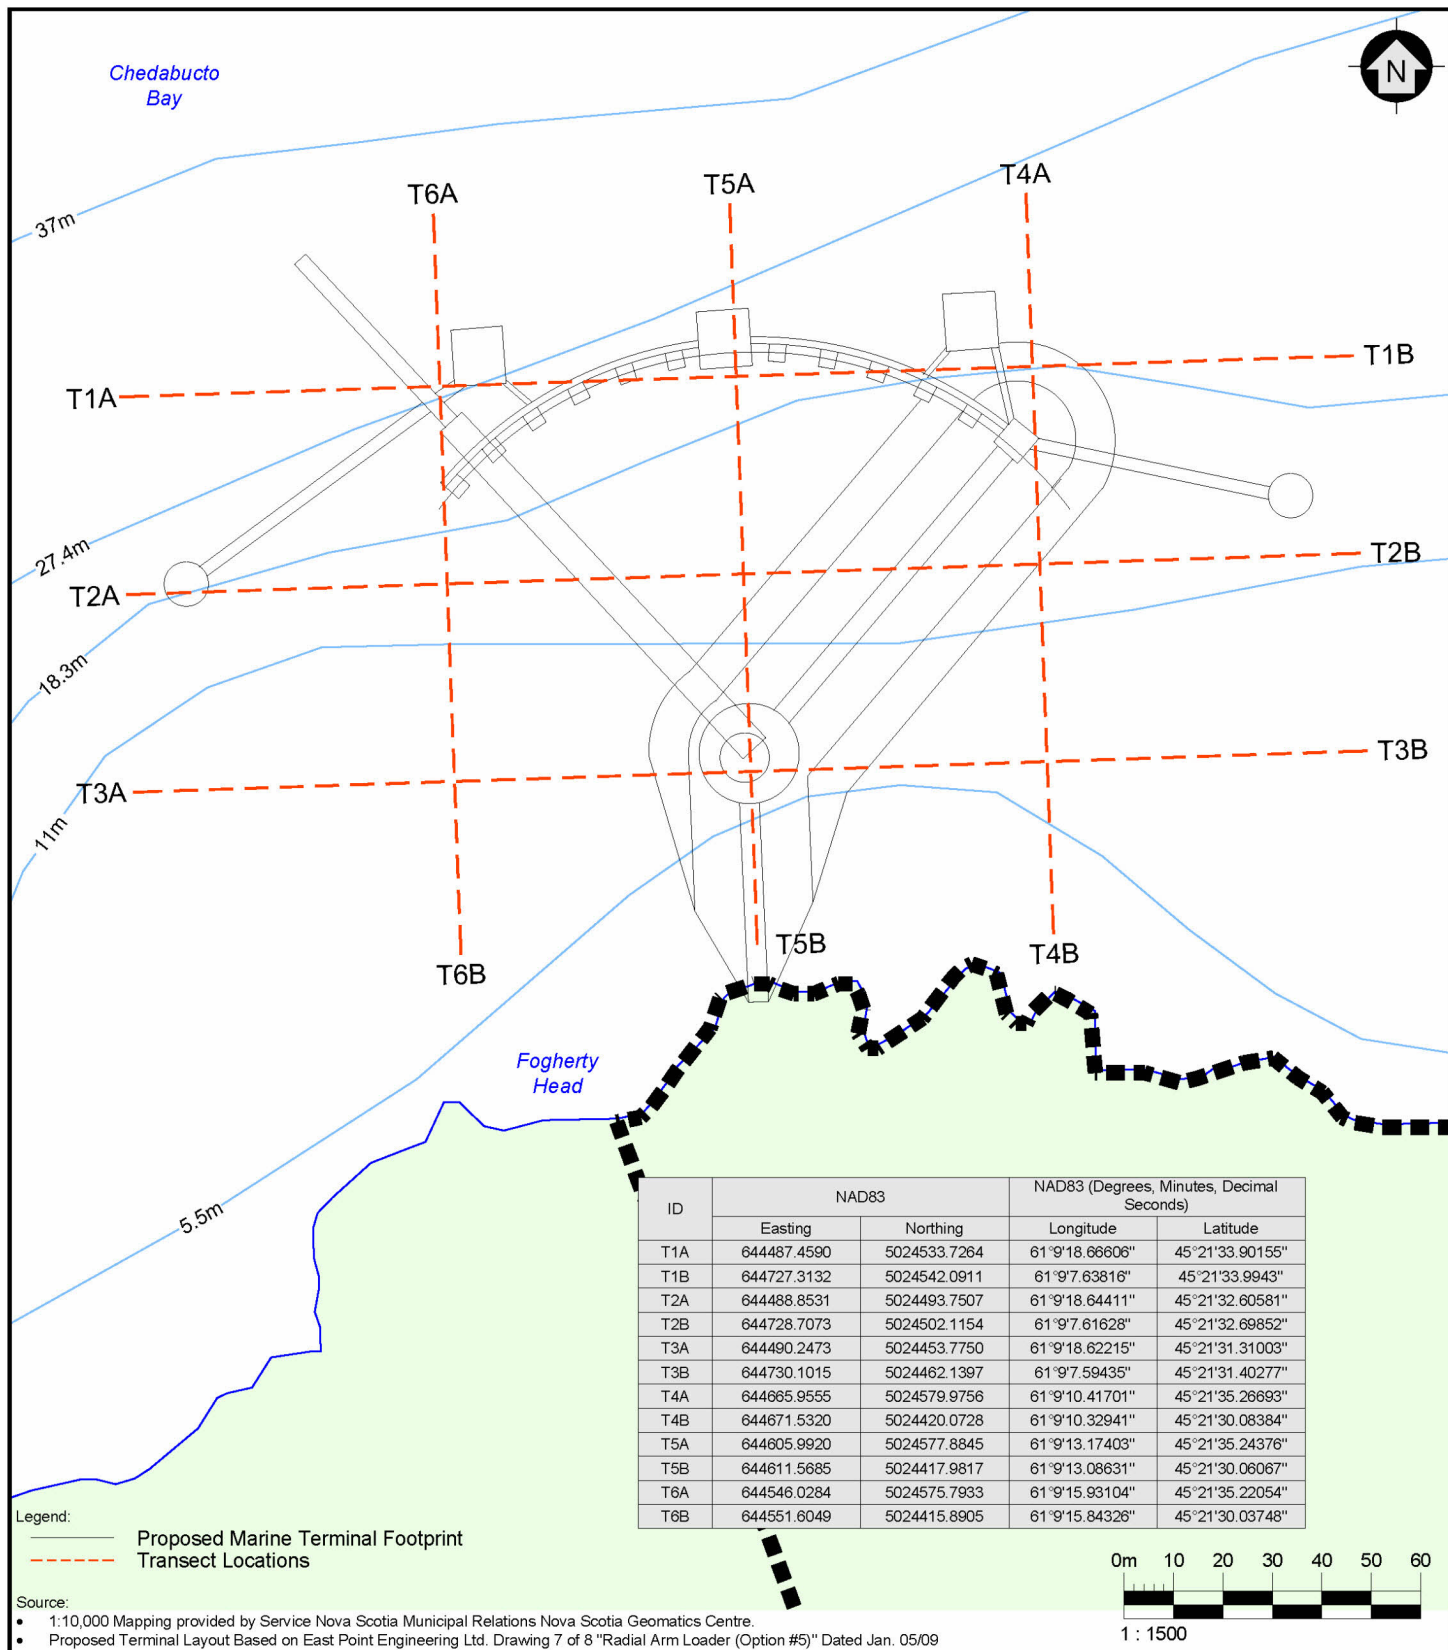

U = Uncommon

Quantifiable observations made infrequently along the 5m segment.

The marine substrate within the characterized area consisted primarily of cobble, rock, and large boulders. Lesser amounts of sand and silt were observed throughout the transects. The high degree hard bottom supports a high diversity of both floral and faunal species.

Algal cover is sparse (0-10%) in deeper waters but increases markedly (50-90%) as the transects approached the near shore areas. The algal canopy is dominated by the brown algal species black whip weed (*Chordaria flagelliformis*), bladderwrack (*Fucus* sp.), and sea colander (*Agarum clathratum*). Other species present in lesser amounts included sugar kelp (*Laminaria saccharina*), tube weed (*Polysiphonia lanosa*), an encrusting red alga (*Leptophyllum* sp.), Irish moss (*Chondrus crispus*), a brown alga (*Pilayella littoralis*), a green alga (*Acrosiphonia arcta*), and a red alga (*Plumaria plumosa*). Of note, green fleece (*Codium fragile*), an invasive species in Nova Scotia (Invasive Species Alliance of Nova Scotia, 2011), was noted along T2. This species has been previously reported from around the Canso area (Watanabe *et al.* 2010).

The hard bottom and algal cover provides habitat for many species. The most common species noted included deep sea scallop (*Placopecten magellanicus*), blue mussel (*Mytilus edulis*), green sea urchin (*Strongylocentrotus droebachiensis*), and American lobster (*Homarus americanus*). Fish species noted along the transects were cunner (*Tautoglabrus adspersus*) and shorthorn sculpin (*Myoxocephalus scorpius*). Other invertebrate species observed along the transects included American oyster (*Crassostrea virginica*), northern rock barnacle (*Semibalanus balanoides*), Bowerbank's halichondria (*Halichondria bowerbanki*), frilled anemone (*Metridium senile*), periwinkle (*Littorina* sp.), sea cucumber (*Cucumaria frondosa*), sea peach (*Holacynthia pyriformis*), sea star (*Asterias* sp.), and waved whelk (*Buccinum undatum*). Due to the depths of the surveyed areas divers had to move at speed greater than optimal for characterization. The combination of the speed of the diver's movement and a cobble bottom resulted in difficulty discerning the presence of small invertebrates such as periwinkles.

6.2 MARINE INVERTEBRATE COMMUNITY SURVEY

6.2.1 Approach and Methodology

Prior to field surveys, a grid was plotted over a map of the footprint of the proposed marine infrastructure, containing at least five times as many squares as the number of required sampling stations. A random number generator software program was then used to derive the sampling locations (squares) within the footprint, which are depicted on Figure 6-2.

Six benthic invertebrate samples were collected at the Project Site on September 1, 2010. Connors Diving Services was contracted by AMEC to perform the sample collection.

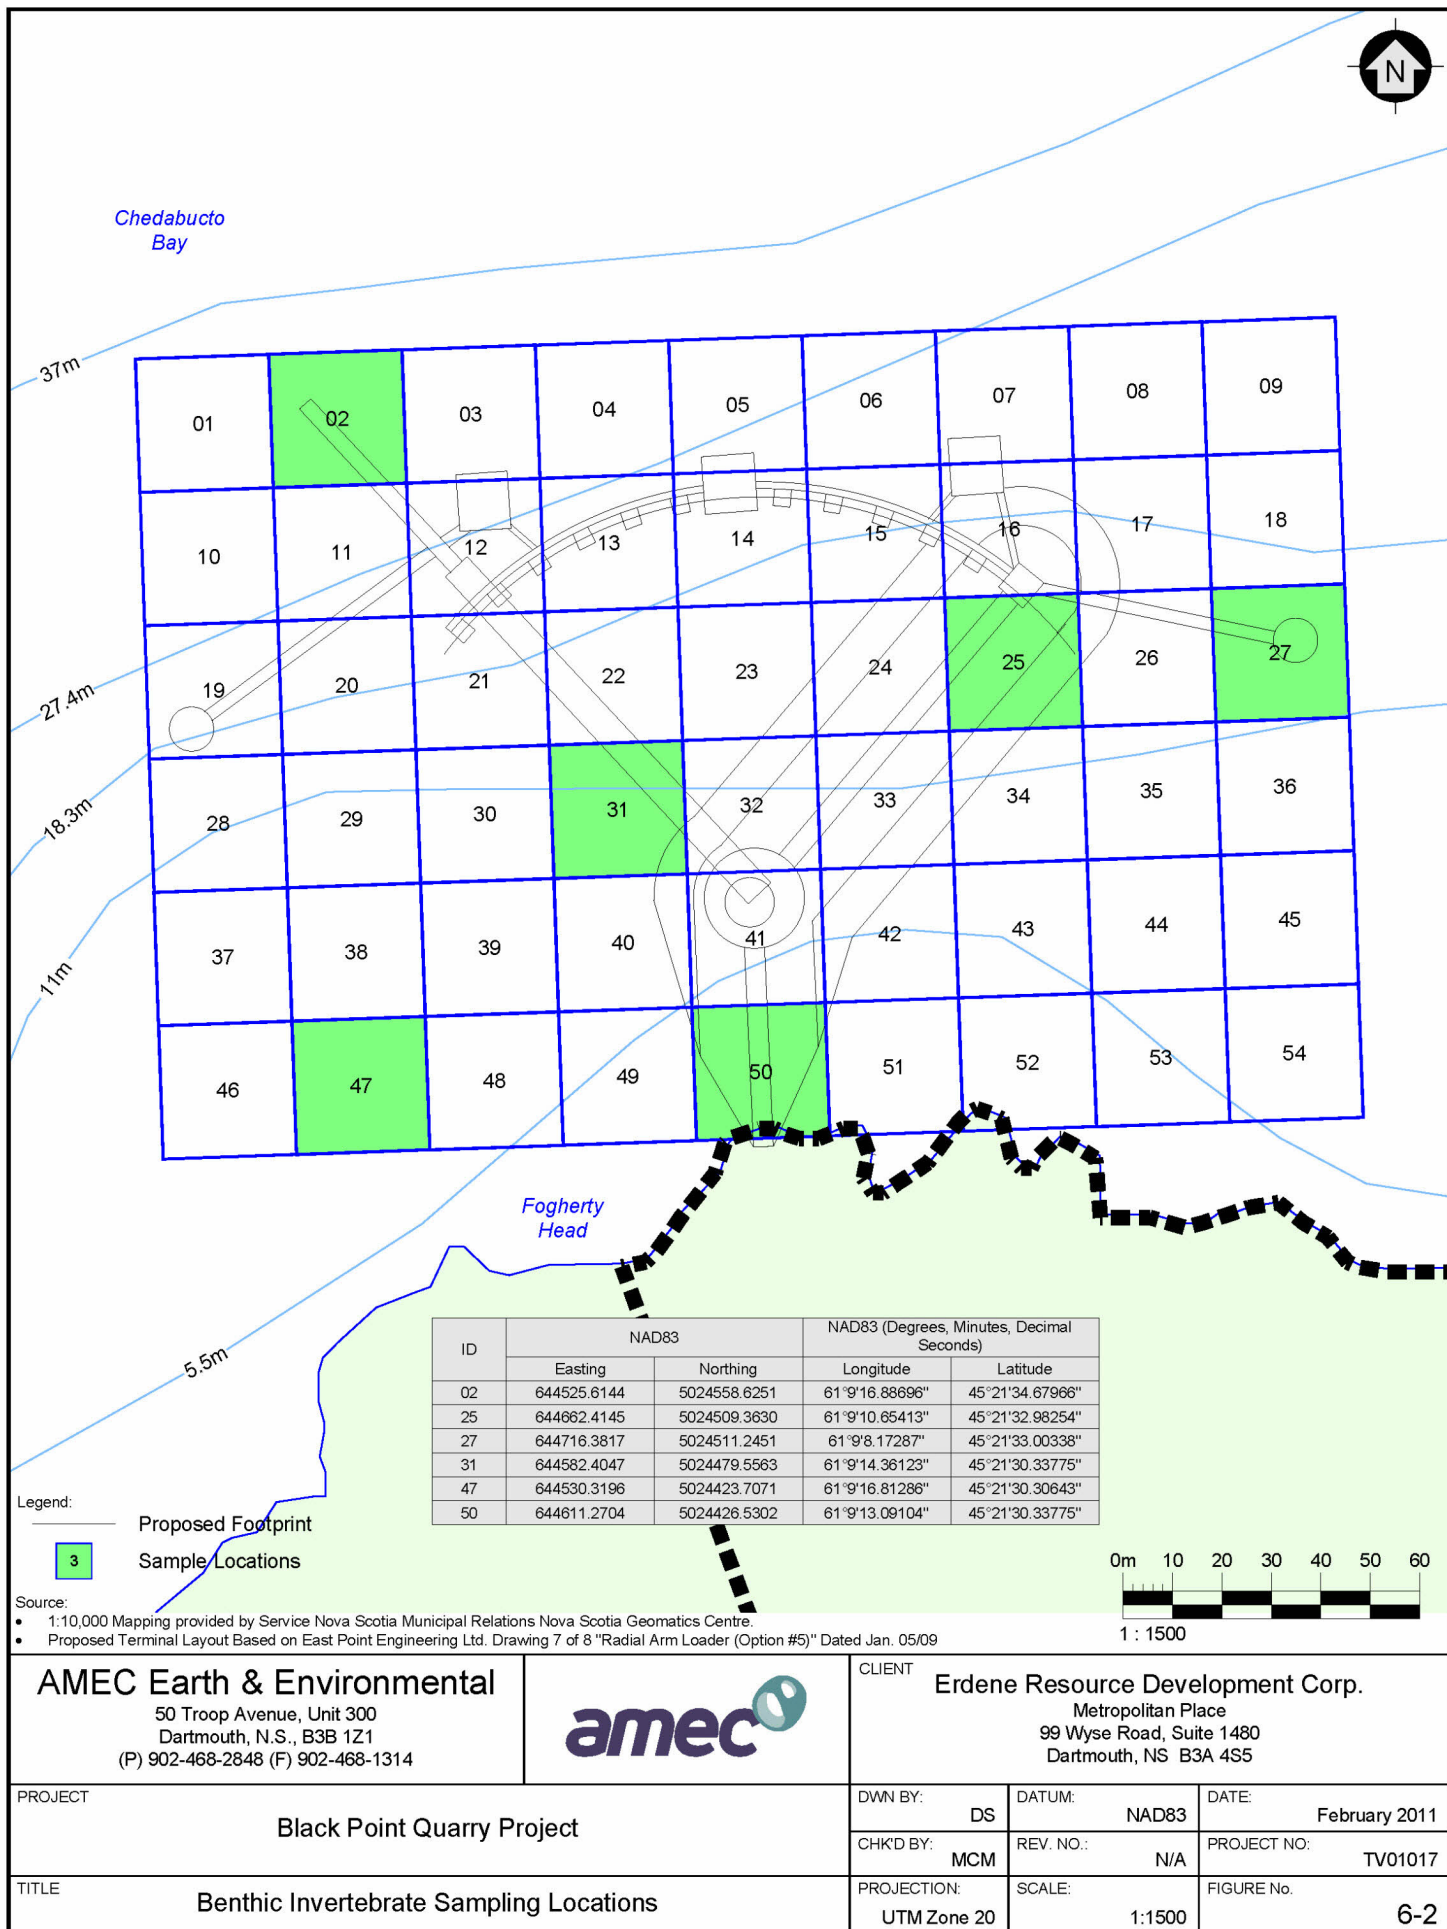

Once on station, the diver placed a 0.25 m² quadrat on the substrate surface and used a small container to penetrate the substrate, as much as was practical, to a depth greater than 5 cm. Several litres of sediment were collected at each of the benthic invertebrate sampling locations. This sediment was placed in a clean 20 L bucket and brought to the support vessel at the surface, where it was thoroughly mixed and 4 L were measured out for the benthic invertebrate sample.

Each sample was sieved through a 1.0 millimetre screen using filtered seawater to remove the risk of osmotic shock to any organisms present. The samples were preserved with 70% isopropanol in one or more 1 L glass Mason jars. Each jar was inverted several times to ensure proper mixing of the contents.

Samples were then shipped to BioTech Inc. (Smithtown, NB), for benthic invertebrate identification and enumeration.

Benthic invertebrate statistical indices compiled for this program consisted of the following:

- Benthic invertebrate identification and enumeration for each station;
- Number of species and number of individuals per species for each station;
- Number of species per station by major taxonomic group; and
- Density (number of organisms/m²) and biomass (g/m² wet weight) for each station.

6.2.2 Baseline Inventory

The total number of organisms collected at each sample station (density) ranged from 109 organisms (436 organisms/m²) at Station 4 to 318 organisms (1,272 organisms/m²) at Station 2. The number of major taxonomic groups represented ranged from 17 at Station 4 to 47 at Station 1. Biomass calculations ranged from 3.24 g/m² at Station 4 to 79.28 g/m² at Station 5.

Three phyla and twelve classes were identified within the collected samples. The most prevalent taxa were the annelid worms (Polychaetes) and molluscs (Gastropods). The most common polychaetes identified include the worm *Aricidea* (syn. *Acmira*) *catherinae*, sinistral spiral tubeworm (*Spirobis borealis*) and cirratulids (*Tharyx* spp.). The most prevalent bivalve species included the common tortoiseshell limpet (*Tectura testudinalis*) and interrupted turbonille (*Turbonilla interrupta*).

A complete list of the species identified is included in Table E.2 1. of Appendix E.2. It should be noted that some bottles were broken during transport. Sample GQ 02 and GQ 47 had two of the three bottles damaged and GQ 27 had one of five bottles broken. Approximately 80% of the spilled sample from each bottle was recovered.

6.3 MARINE SEDIMENT SAMPLING PROGRAM

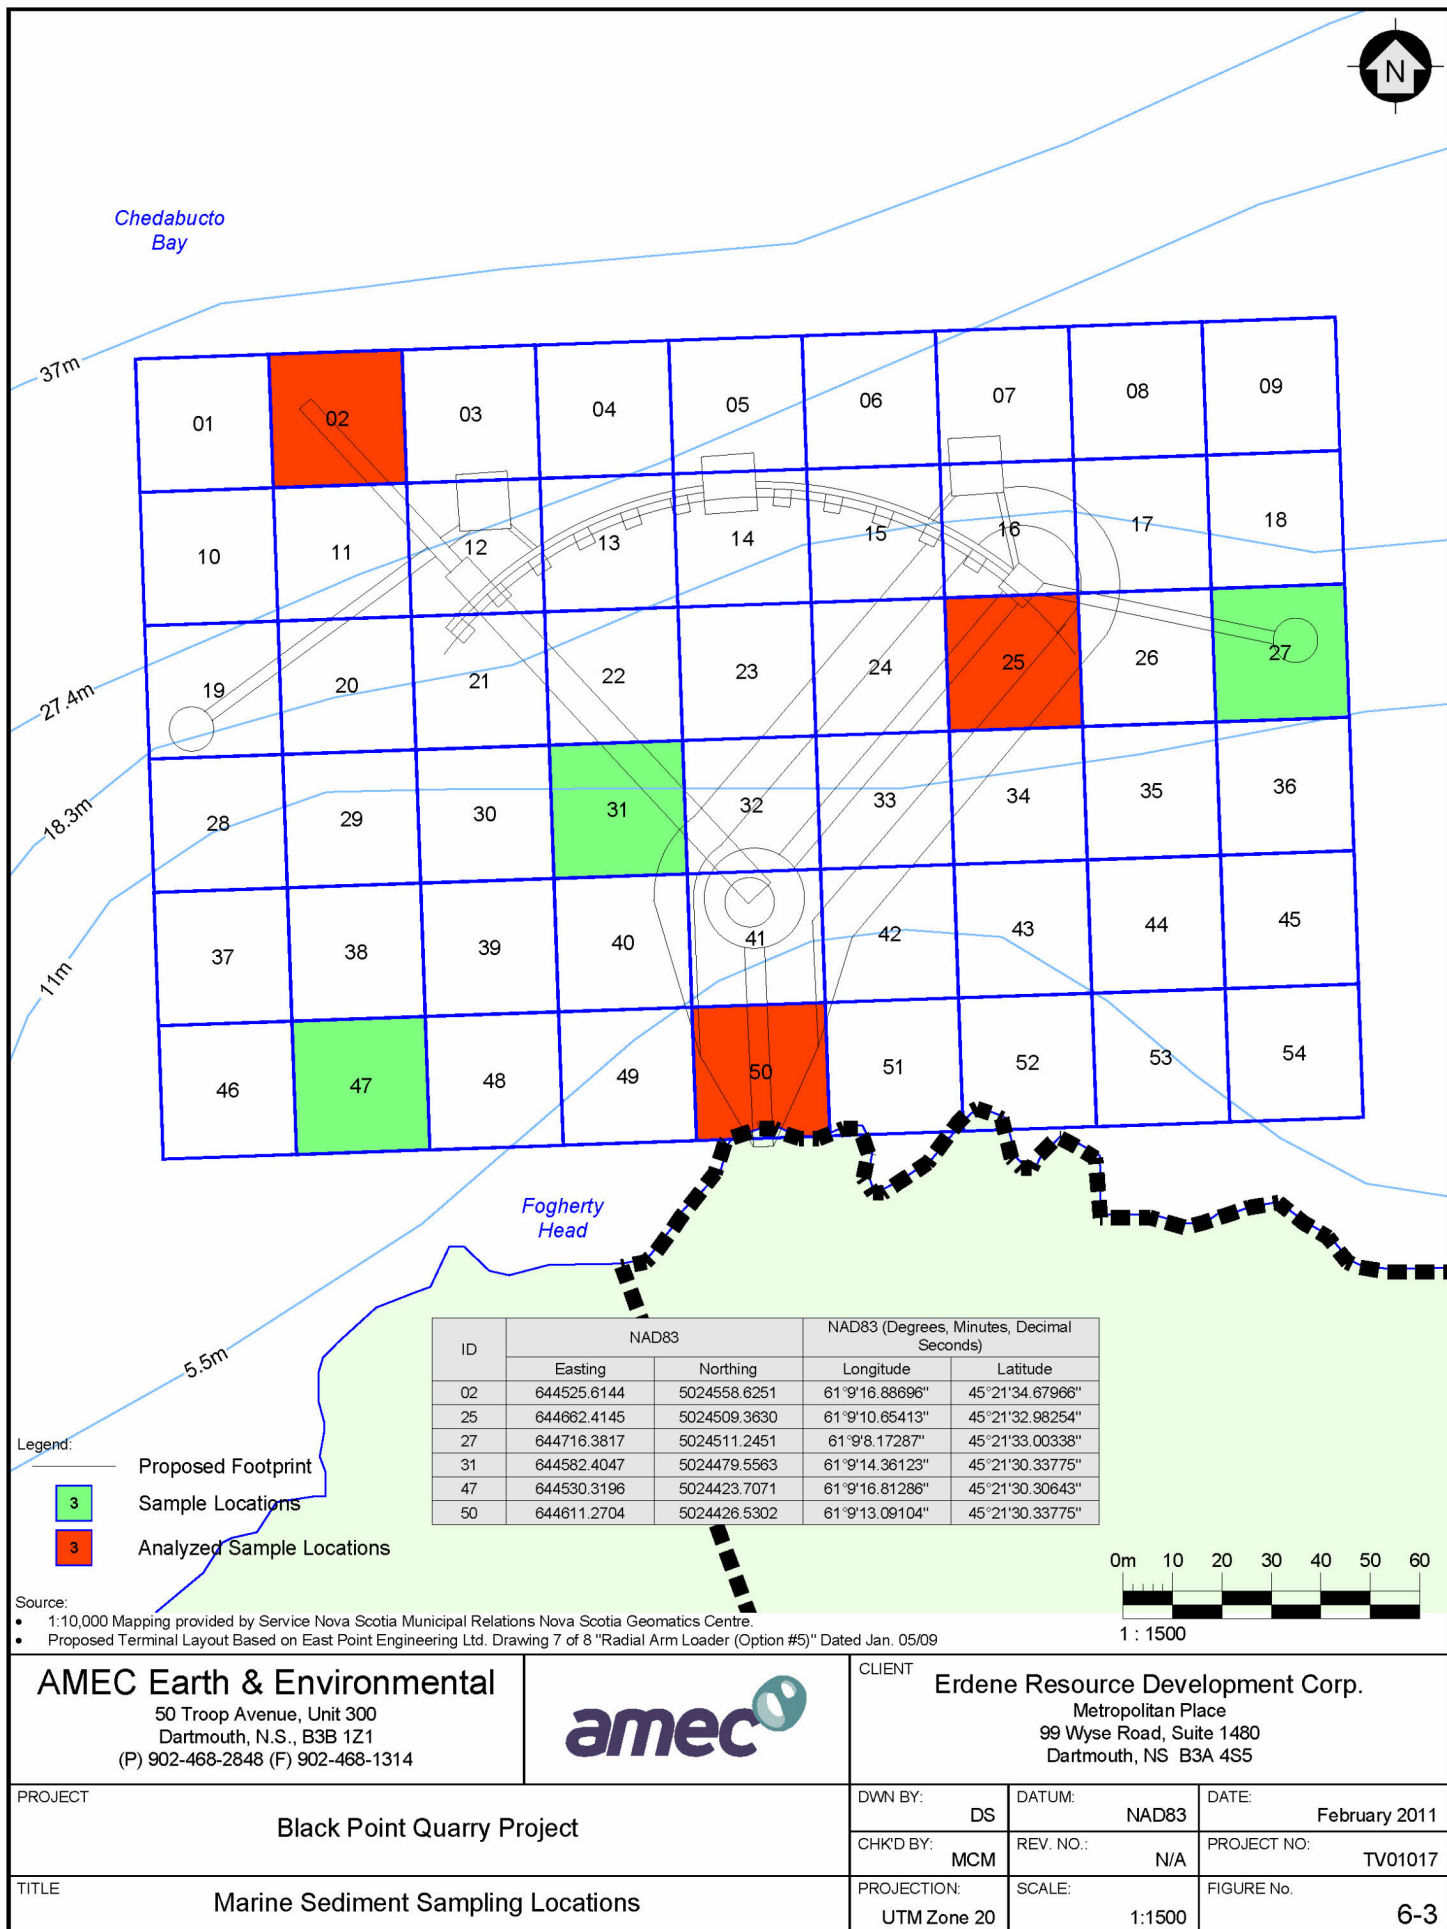

6.3.1 Approach and Methodology

The sample collection, preparation, and analyses were conducted in accordance with Environment Canada's publication *Guidance Document on Collection and Preparation of Sediments for Physicochemical Characterization and Biological Testing*, December 1994. Connors Diving Service was retained to collect the sediment samples.

A total of six marine sediment samples were collected on September 1, 2010 from within the footprint of the proposed marine infrastructure. A handheld Garmin Global Positioning System (GPS) was used to locate the sampling locations selected by AMEC prior to field program initiation. The coordinates of the sampling locations are listed on Figure 6-3 as UTM (Universal Transverse Mercator) and latitude and longitude (dd mm ss.sss) (Datum: NAD 83).

The sediment sample was obtained from the same well-mixed sample of substrate as the benthic invertebrate sample (outlined previously).

As per laboratory protocol, two 250 millilitre (ml) jars of sediment were collected per station. An additional 250 ml jar of sediment was collected at each of the sampling locations to safeguard against loss or damage during transport.

Following sample collection, all samples were placed in a cooler on ice and delivered to Maxxam Analytics Inc. (Maxxam), in Bedford, NS for the required chemical analyses. Maxxam is accredited with the Standards Council of Canada (SCC).

Three of the six samples (GQ 02, GQ 25, and GQ 50; Figure 6-3) were analyzed for metals including mercury, hexavalent chromium, and low level selenium and tin; low level polycyclic aromatic hydrocarbons (PAHs); polychlorinated biphenyls (PCBs); low level benzene, toluene, ethylbenzene, and xylene (BTEX) including an assessment for presence/absence of creosote; total petroleum hydrocarbons (TPHs); total inorganic and total organic carbon (TIC/TOC); total dichloro-diphenyl-trichloroethane (DDT) (including 2,4'- and 4,4'-dichloro-diphenyldichloroethylene (DDE), 2,4'- and 4,4'-dichlorodiphenyldichloroethane (DDD), and 2,4'- and 4,4'-DDT); and grain size.

In order to facilitate the determination of all disposal options for sediment potentially removed during the construction of the proposed Project, the analytical sample results were compared to the following:

- *Canadian Environmental Protection Act (CEPA) Disposal at Sea Regulations (formerly the Ocean Dumping Control Act)*;
- Canadian Council of Ministers of the Environment (CCME) Probable Effects Levels (PELs) for marine/estuarine sediment;
- CCME Soil Quality Guidelines (SQGs) for the Protection of Environment and Human Health in agricultural, residential/parkland, and commercial/industrial applications; and
- Atlantic Risk-Based Corrective Action (RBCA) Tier 1 Version 2.0 Risk-Based Screening Levels (RBSLs).

6.3.2 Baseline Inventory

The analytical results of the three marine sediment samples analyzed are summarized in Tables E.3-1 to E.3-4 (Appendix E.3). The complete set of analytical results, including laboratory Quality Assurance/Quality Control and Certificates of Analyses for all parameters tested, are provided in Appendix E.4.

There were no exceedances noted for any of the abovementioned guidelines.

Two samples (GQ 25 and GQ 50) were predominantly gravel (76-82%) with lesser amounts of sand (16-19%), silt (1-3%), and clay (<1-1%). Sample GQ 02 was a mix of gravel (51%) and sand (42%) with lesser amounts of silt (5%) and clay (3%) (Table E.3-5 in Appendix E.3). The three samples collected and analyzed had total carbon contents ranging from 0.6 to 1.62 grams per kilogram (g/kg) (Table E.3-5 in Appendix E.3).

Odonata Report

Odonata Survey 2010 (Damselflies and Dragonflies) Black Point Quarry

Prepared for:
AMEC Earth and Environmental

Paul M. Brunelle
January 26 2011

Paul Brunelle and Beth Cameron spent five field days, over the periods June 9th to 11th and July 14th to 16th, surveying for adult Odonata in the proposed Black Point Quarry locale, near Black Point, Guysborough County, Nova Scotia. All types of freshwater aquatic habitats identified on the property were sampled.

The 2010 season was an unusually early one for odonate flight, and emergence in the Black Point area was just beginning during the first visit – the flight period at this locale is apparently heavily influenced (delayed) by the moderation from coastal weather, as it is adjacent to the ocean to the north, and only about 14km from it to the south.

There is no known prior survey for Odonata in the project area, and Guysborough County itself has been rather lightly surveyed to date.

Results

A modest diversity of Odonata species was encountered – 25 species (22%) of the 115 recorded in Mainland Nova Scotia. A further 41 species are considered possible for the habitat types known on the property, and at these latitudes, consequently 38% of the potential list was taken in 2010.

Forty-seven records (species/site/date) were recorded.

The greatest number of species taken at any one site was twelve; at Wetland 12 (site NS1690, a true bog), with nine at Wetland 2, Ponds 1 and 2 (site NS1697) being second. Most habitats proved to be sparse in species during the visits.

One species of conservation interest in Nova Scotia was encountered, at Wetland 12 (NS1690, a true bog). A male *Pantala hymenaea* (Say 1839, Spot-winged Glider), ranked as Yellow by NSDNR, was observed several times at a secondary pond, at times apparently guarding an ovipositing *P. flavescens* (Fabricius 1798, Wandering Glider). Although *Pantala* species have been observed ovipositing in bog ponds before, it is not known whether that is a viable habitat for the extremely rapid growth of their larvae, a characteristic of this migratory genus. Extra-specific guarding, possibly indicating hybridization, has not been observed in the region in this genus before.

Following Brunelle's involvement AMEC staff took a number of further specimens which were determined by Brunelle; the results given in Appendix 3.

On the cover:

Fogherty Head Shoreline, site NS1698, Guysborough County, Nova Scotia, June 11, 2010.

Left side (top down):

Leucorrhinia glacialis Hagen 1890, Crimson-ringed Whiteface, teneral male, site NS1694, Wetland 17, June 11, 2010.

Enallagma boreale (Selys 1875), Boreal Bluet.

Dorocordulia lepidia (Hagen in Selys 1871), Petite Emerald, female.

Survey Tactics

Methodology for survey, curation and documentation followed the ADIP (Atlantic Dragonfly Inventory Program) protocols, which have evolved over the last twenty years, and which reflect current practice in the study of odonates.

Habitat Location

After discussions with the client, airphotos of the project region were reviewed and a target aquatic habitat list prepared. This list was confirmed and amended during the field trips.

Each site was given an ADIP identification code beginning with 'NS'.

Field Survey

Personnel

All survey was done by Paul M. Brunelle and Beth H. Cameron.

Lifestage

Principal survey was for flying adults and teneral (the latter are recently-emerged adults), however exuviae (the abandoned skins of the emerged insects) were also collected when found. Exuviae collection may present the most effective means of inventory for these habitats, and firmly establishes residence status (see Appendix 1), however field survey must be scheduled carefully to collect this material, and tends to be protracted.

Larval survey can yield excellent information on the residence status of species, however it is decidedly protracted in the field and in the lab.

Adults were captured by net and retained in field envelopes until preserved.

Frequency of Survey

One visit to a water body per year is insufficient to acquire a reasonably complete species list, due to the diverse flight periods of species, however the results of even one trip per year can be suggestive as to the health of the aquatic habitat.

For this project all sites were visited at least twice.

Diel

Survey was done during the peak periods of adult odonate activity, roughly 10:00 to 17:00.

Weather

Field days were chosen which had weather suitable for surveying for adults – sunny and hot, with no more than moderate winds. However, extensive overcast developed during some survey days and rain ended a few days early.

Voucher Specimens

Specimens were taken *pro forma* in many cases, and in all cases where field determination of particular species was considered untrustworthy.

The specimens were force-dried in acetone (adults and teneralis) or air-dried (exuviae) and are stored in clear mylar envelopes with a label giving all identification and accession information.

Each specimen was given a 6-digit ADIP accession number, unique among specimens of odonates taken in Atlantic Canada and northern New England and catalogued in the ADIP databases. The accession number has an alphabetical suffix which indicates the provenance on which the record is based;

- v vouchered specimen,
- o observed on the wing or perched,
- h determined in the hand then released,
- p photographed, and,
- c indicating that the determination of vouchers has been confirmed by another worker.

The specimens have been deposited at the Nova Scotia Museum of Natural History, Halifax.

Documentation

Photography

General habitat photos were taken during each visit, converted to jpg format, catalogued, and will be tendered to the client for project use if requested.

Data

Field notes, species observations and specimen details were entered into a Filemaker Pro 8.5 relational database structure, which will be translated into Excel 11.3.5 database form for deposit with the client.

Family Gomphidae cont...	C.04
Family Cordulegastridae	C.04
Family Macromiidae	C.04
Family Corduliidae	C.04
Family Libellulidae	C.05
Appendix 1: Status and Rank Definitions	D.01
Appendix 2: The Nature of Odonates	D.02
Appendix 3: Supplementary Odonata Specimens	D.03
Appendix 4: Site Map	D.04

Sites are listed by aquatic type, then by name (some are generic names). The wetland ‘names’ are the identifiers used by AMEC Earth and Environmental, which pertain to studies of a broader taxonomic base.

A map of sites is given in Appendix 4.

In the accounts the ADIP (Atlantic Dragonfly Inventory Program) site code is given first, followed by the field code in brackets.

The Nova Scotia mapbook grid is given next, followed by the grid for the previous series of mapbooks, which were on a different grid and are still employed by some authorities. The National Topographic Information System (NTIS) 1/50,000 map reference is then provided.

Coordinates are given in decimal notation, followed by them formatted in a manner which facilitates their lookup in the Google Earth web software.

Visits were all made in 2010. The month and day are given first, followed by the time on site and minutes used, the amount of sky coverage (averaged, the amount of cloud will generally have varied during the visit), and the strength of the wind.

P.M. Brunelle and B.H. Cameron were present during all visits.

Species encountered are listed in taxonomic order to family, in alphabetical order by genus and species. The scientific name is first given, followed by the attribution and description date, then the accepted English name and family.

The ranking by various authorities is then given (see Appendix 1 for details);

NTSV G = NatureServe Global Rank,
NGSCDA = National General Status Canadian Rank,
NSDNR = NS Dept. of Natural Resources Colour Rank,
NGSNS = National General Status Nova Scotia Rank,
NTSV S = NatureServe Nova Scotia Rank.

Records of the species encountered are first given by their ADIP record number, with an alphabetical suffix indicating the provenance of the record. The month and day of the date are next, followed by the surveyor of record (COLL.), if only one individual.

Lifestage(s) encountered are then given (see Appendix 2 for definitions), followed by the ADIP Residence Status code (RSTAT), which indicates the degree to which we know or infer that the species is present in the aquatic habitat through the full development of individuals (see Appendix 2), and hence whether the record has conservation significance. A brief explanation of the code is also given.

Code Site: NS1689 (aka FoL).
Mapbook: 43y04 (old 35e02), NTIS Map: 11F6.
45.3489°N, -61.1589°W [45.348904N, 61.158904W].

Visits:

June 9 – 14:30 to 15:10 (40 min), cloudy 90%, light to moderate.
June 10 – 10:25 to 15:15 (95 min), sunny 95%, light to moderate.
July 16 – 11:45 to 12:30 (45 min), sunny 100%, none to light.

All Species Recorded – 5.

Enallagma boreale (Sélys 1875)

Boreal Bluet, Coenagrionidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.
Record 313060v, July 16, COLL. Beth H. Cameron.

Adult, Teneral, RSTAT 1 (emergence proven).

Basiaeschna janata (Say 1839)

Springtime Darner, Aeshnidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.
Record 313048o, June 10, Adult,

RSTAT 8 (males at appropriate habitat).

Somatochlora cingulata Sélys 1871

Lake Emerald, Corduliidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S2.
Record 313079o, July 16, Adult,

RSTAT 8 (males at appropriate habitat).

Ladona julia (Uhler 1857)

Chalk-fronted Corporal, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.
Record 313029v, June 9, Teneral,

RSTAT 1 (emergence proven).

Pantala flavescens (Fabricius 1798)

Wandering Glider, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV SA.
Record 313078o, July 16, Adult,

RSTAT 10 (not at water).

Comments: This lake appears to have an unusually short odonate list.

Code Site: **NS1697** (aka FBBP).
Mapbook: 43y04 (old 35e02), NTIS Map: 11F6.
45.35508°N, -61.14255°W [45.355083N, 61.142546W].

Visits:

June 11 – 14:10 to 14:45 (35 min), sunny 100%, none to light.
July 15 – 10:25 to 12:40 (125 min), sunny 100%, none to light.

All Species Recorded – 9.

***Lestes disjunctus* Sélys 1862**

Common Spreadwing, Lestidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S5.

Record 313071v, July 15, COLL. Paul M. Brunelle,
Beth H. Cameron. Teneral, RSTAT 1 (emergence proven).

***Enallagma boreale* (Sélys 1875)**

Boreal Bluet, Coenagrionidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.

Record 313074v, July 15, COLL. Beth H. Cameron.

Adult, RSTAT 8 (males at appropriate habitat).

***Enallagma ebrium* (Hagen 1861)**

Marsh Bluet, Coenagrionidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.

Record 313075v, July 15, Adult,

RSTAT 8 (males at appropriate habitat).

***Enallagma hageni* (Walsh 1863)**

Hagen's Bluet, Coenagrionidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.

Record 313073v, July 15, COLL. Beth H. Cameron.

Adult, RSTAT 8 (males at appropriate habitat).

***Ischnura posita* (Hagen 1861)**

Fragile Forktail, Coenagrionidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.

Record 313076v, July 15, Adult,

RSTAT 8 (males at appropriate habitat).

***Ischnura verticalis* (Say 1839)**

Eastern Forktail, Coenagrionidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S5.

Record 313070v, July 15, COLL. Beth H. Cameron.

Adult, Teneral, RSTAT 1 (emergence proven).

***Aeshna interrupta interrupta* Walker 1908**

Variable Darner, Aeshnidae.

NTSV G5T5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.

Record 313072v, July 15, Exuvia,

RSTAT 1 (emergence proven).

***Libellula quadrimaculata* Linnaeus 1758**

Four-spotted Skimmer, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S5.

Record 313077v, July 15, Adult,

RSTAT 8 (males at appropriate habitat).

***Sympetrum internum* Montgomery 1943**

Cherry-faced Meadowhawk, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S5.

Record 313081v, July 15, Teneral,

RSTAT 1 (emergence proven).

Comments: Barrachois ponds bordered by both bog and *Typha latifolia* marsh. They are likely inundated by seawater periodically, but nevertheless house a comparatively large odonate list.

Code Site: **NS1695** (aka LMSW).
Mapbook: 43y04 (old 35e02), NTIS Map: 11F6. CHECK
45.33996°N, -61.138757°W [45.33996N, 61.138757W]. CHECK

Visits:

June 11 – 11:10 to 11:30 (20 min), sunny 100%, none to light.

July 14 – 13:35 to 14:25 (50 min), light overcast, none to light.

All Species Recorded – 0.

Comments: A stillwater formed by a beaver dam. Although some *Aeshna* species (determination to species was not possible) were seen flying over the ponds on July 14th, they otherwise showed no odonate species, however weather was not ideal for odonates during the second visit.

Code Site: **NS1702** (aka FBBB).

Record 313057v, June 10, COLL. Beth H. Cameron.

Larva, Molt, RSTAT 2 (larvae collected).

Record 313091v, July 16, COLL. Beth H. Cameron.

Exuvia, RSTAT 1 (emergence proven).

***Cordulia shurtleffii* Scudder 1866**

American Emerald, Corduliidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.

Record 313031v, June 10,

Teneral, RSTAT 1 (emergence proven).

***Ladona julia* (Uhler 1857)**

Chalk-fronted Corporal, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.

Record 313056v, June 10, Teneral, Exuvia (assoc.),

RSTAT 1 (emergence proven).

Record 313061o, July 16, Adult,

RSTAT 8 (males at appropriate habitat).

***Leucorrhinia glacialis* Hagen 1890**

Crimson-ringed Whiteface, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.

Record 313055v, June 10,

Teneral, Exuvia (assoc.), RSTAT 1 (emergence proven).

Record 313062v, July 16, COLL. Beth H. Cameron.

Adult, RSTAT 3 (ovipositing observed).

***Pantala flavescens* (Fabricius 1798)**

Wandering Glider, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV SA.

Record 313063o, July 16, Adult,

RSTAT 3 (ovipositing observed).

***Pantala hymenaea* (Say 1839)**

Spot-winged Glider, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Yellow, NGSNS 3, NTSV SA.

Record 313064o, July 16, Adult,

RSTAT 8 (males at appropriate habitat).

***Sympetrum internum* Montgomery 1943**

Cherry-faced Meadowhawk, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S5.

Record 313066v, July 16,

COLL. Paul M. Brunelle. Teneral, RSTAT 1 (emergence proven).

Comments: A true domed bog, with secondary ponds and peripheral fens.
 The odonate list is extensive, but probably not complete.

Code Site: **NS1694** (aka SEPF).
Mapbook: 43y04 (old 35e02), NTIS Map: 11F6.
45.34038°N, -61.14361°W [45.340379N, 61.143614W].

Visits:

June 11 – 10:15 to 10:50 (35 min), sunny 100%, none to light.

July 14 – 12:20 to 13:15 (55 min), sunny 100%, none to light.

All Species Recorded – 4.

Nehalennia gracilis Morse 1895

Sphagnum Sprite, Coenagrionidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S2.

Record 313058v, July 14,

Adult, Teneral, RSTAT 1 (emergence proven).

Leucorrhinia glacialis Hagen 1890

Crimson-ringed Whiteface, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.

Record 313041v, June 11,

Teneral, Exuvia (assoc.), RSTAT 1 (emergence proven).

Record 313059v, July 14, COLL. Beth H. Cameron.

Adult, RSTAT 8 (males at appropriate habitat).

Leucorrhinia hudsonica (Selys 1850)

Hudsonian Whiteface, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.

Record 313054v, June 11,

Adult, RSTAT 8 (males at appropriate habitat).

Leucorrhinia proxima Calvert 1890

Belted Whiteface, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR Green, NGSNS 4, NTSV S3.

Record 313088v, July 14, COLL. Beth H. Cameron.

Adult, RSTAT 8 (males at appropriate habitat).

Comments: This fairly rich domed fen should support a larger odonate list than was recorded.

Code Site: **NS1696** (aka ECPF).
Mapbook: 43y04 (old 35e02), NTIS Map: 11F6.
45.34126°N, -61.13718°W [45.341262N, 61.137182W].

Visits:

June 11 – 11:55 to 12:30 (35 min), sunny 100%, none to light.

July 14 – 14:45 to 15:00 (15 min), heavy overcast, none.

All Species Recorded – 2.

Epitheca (Tetragoneuria) spinigera (Selys 1871)

Spiny Baskettail, Corduliidae,

NTSV G5, NGSCDA 4, NSDNR **Green**, NGSNS 4, NTSV S3.

Record 313042o, June 11, Adult,

RSTAT 9 (inappropriate habitat).

Leucorrhinia hudsonica (Selys 1850)

Hudsonian Whiteface, Libellulidae.

NTSV G5, NGSCDA 4, NSDNR **Green**, NGSNS 4, NTSV S3.

Record 313043o, June 11, Adult,

RSTAT 8 (males at appropriate habitat).

Comments: A small true bog a short distance north of the power-line cut along the eastern property cutline. The list of odonates observed at this site seemed depauperate.

Code Site: **NS1693** (aka FB).
Mapbook: 43y04 (old 35e02), NTIS Map: 11F6.
45.345431°N, -61.161658°W [45.345431N, 61.161658W].

Visits:

June 9 – 17:15 to 17:25 (10 min), cloudy 90%, light to moderate.

June 10 – 09:30 to 09:50 (20 min), sunny 95%, light to moderate.

All Species Recorded – 0.

Comments: This small stream drains Wetlands 8 and 9, flowing through forested bog and largely over bedrock. It has very little substrate other than that bedrock, and no odonate species were observed during the visits. This site is likely representative of the upper reaches of all brooks on the property.

Code Site: **NS1703** (aka LMSB).
Mapbook: 43y04 (old 35e02), NTIS Map: 11F6. CHECK
45.34038°N, -61.14361°W [45.340379N, 61.143614W]. CHECK

Visits:

June 11 – visited briefly in passing.

July 14 – visited briefly in passing.

All Species Recorded – 0.

Comments: This stream was visited where it drains the Beaverpond (site NS1695), and hence at that locale is just south of the project footprint. It flows strongly through forest, is heavily shaded, and likely represents the habitat type of the lower courses of most running waters on the property.

Barrens

Code Site: **NS1701** (aka FBa).
Mapbook: 43y04 (old 35e02), NTIS Map: 11F6.
45.34583°N, -61.15409°W [45.345826N, 61.154094W].

Visits: The barrens were passed through on all survey days.

All Species Recorded – 1.

Enallagma boreale (Selys 1875)

Boreal Bluet, Coenagrionidae.

NTSV G5, NGSCDA 4, NSDNR **Green**, NGSNS 4, NTSV S3.

Record 313050v, June 10, Adult, RSTAT 10 (not at water).

Comments: The barrens have very little soil over granite bedrock – no likely odonate habitats were seen, they seem well-drained.

Shoreline

Code Site: **NS1698** (aka FHS).
Mapbook: 43y03 (old 35e02), NTIS Map: 11F6.
45.35742°N, -61.1459°W [45.357415N, 61.145902W].

Visits:

June 11 – 13:15 to 15:40 (95 min), sunny 100%, none to light.

July 15 – 10:00 to 18:00 (120 min), sunny 100%, none to light.

All Species Recorded – 4.

Anax junius (Drury 1770)

Common Green Darner, Aeshnidae.

NTSV G5, NGSCDA 4, NSDNR **Green**, NGSNS 4, NTSV S3.

Record 313068o, July 15, Adult, RSTAT 10 (not at water).

Cordulia shurtleffii Scudder 1866

American Emerald, Corduliidae.

NTSV G5, NGSCDA 4, NSDNR **Green**, NGSNS 4, NTSV S3.

Record 313045o, June 11, Adult, RSTAT 10 (not at water).

Epithea (Tetragoneuria) spinigera (Selys 1871)

Spiny Baskettail, Corduliidae

NTSV G5, NGSCDA 4, NSDNR **Green**, NGSNS 4, NTSV S3.

Record 313044o, June 11, Adult, RSTAT 10 (not at water).

Somatochlora cingulata Selys 1871

Lake Emerald, Corduliidae.

NTSV G5, NGSCDA 4, NSDNR **Green**, NGSNS 4, NTSV S2.

Record 313069v, July 15, COLL. Beth H. Cameron.

Adult, RSTAT 10 (not at water).

Comments: An abrupt, cliffed shoreline with cobble beaches – the only potential odonate habitat seen there was pools in the bedrock. No odonates were seen in the pools. All adults taken along the shore appeared to be foraging.

Woods

Code Site: **NS1699** (aka FHW).
Mapbook: 43y03 (old 35e02), NTIS Map: 11F6.
45.35379°N, -61.15743°W [45.353793N, 61.157434W].

Visits: The woods were passed through on most survey days.

All Species Recorded – 1.

Cordulia shurtleffii Scudder 1866

American Emerald, Corduliidae.

NTSV G5, NGSCDA 4, NSDNR **Green**, NGSNS 4, NTSV S3.

Record 313047o, June 11, Adult, RSTAT 10 (not at water).

Comments: The woods on the property are either dense coniferous growth, with a mossy forest floor, or dense stands of woody brush. Only foraging odonates were seen in the forest.

The full list of odonates for the province is provided in the following table. Species encountered during 2010 survey are highlighted in yellow.

Species have been characterized as occupying the following basic habitat types;

lotic obligate (running waters, blue) – 13 species, possibilities for running waters on the property,

peatlands obligate (brown) – 23 species, possibilities for bogs on the property,

saltmarsh obligate (green) – 1 species (*E. berenice*),

The balance are lentic (slow waters) inhabitants, possibilities for the property.

Note that there are issues of range within the province (latitude and elevation related), micro-habitat preferences, and flexibility of habitat use which have not been addressed in this basic assignment.

The various status ranks are given and are current (see Appendix 1 for definitions); those of conservation interest are given in bold.

The best residence status and the greatest observed abundance of each species encountered at each site is given in the site columns.

Conservation Statuses

Italic comments are by Brunelle.

NatureServe Global Ranks

- G1** Extremely rare throughout its range (typically 5 or fewer occurrences or very few remaining individuals). May be especially vulnerable to extirpation.
- G2** Rare throughout its range (6 to 20 occurrences or few remaining individuals). May be vulnerable to extirpation due to rarity or other factors.
- G3** Uncommon throughout its range, or found only in a restricted range, even if abundant in at some locations. (21 to 100 occurrences).
- G4** Usually widespread, fairly common throughout its range, and apparently secure with many occurrences, but the Element is of long term concern (e.g. watch list, 100+ occurrences).
- G5** Demonstrably widespread, abundant, and secure throughout its range, and essentially ineradicable under present conditions.
- T** This suffix indicates that there is some taxonomic confusion with the species.
- /** This indicates that the rank is intermediate between two ranks.

National General Status Ranks – Canada and Nova Scotia

- 1 At risk:** species for which a formal assessment has been completed and determined to be at risk of extirpation or extinction (i.e., endangered or threatened).
- 2 May be at risk:** species that may be at risk of extirpation or extinction, and are therefore candidates for a detailed risk assessment.
- 3 Sensitive:** species which are not believed to be at risk of extirpation or extinction, but may require special attention or protection to prevent them from becoming at risk.
- 4 Secure:** species which are not believed to be 'at risk' or 'sensitive'.
- 5 Undetermined:** species for which insufficient data, information, or knowledge is available to reliably evaluate their status. Generally rare where known.
- 6 Not assessed:** species known or believed to be present but which have not yet been assessed. This status is usually is applied to recent discoveries.
- 7 Exotic:** species that have been introduced as a result of human activity.
- 8 Extirpated/extinct:** species no longer thought to be present in the jurisdiction or that are believed to be extinct.
- 9 Accidental/vagrant:** species occurring infrequently and unpredictably, outside their usual range.

Nova Scotia DNR Colour Ranks

- Red** May be at risk (Re).
- Yellow** Sensitive (Ye).
- Green** Secure (Gr)
- Blue** Thought to be extirpated (Bl).
- Accidental** Thought not to be resident (Ac).
- Indeterminate** Rank not determined (In). Generally rare and of conservation concern, or the subject of taxonomic concerns. This rank is also given to recent additions to the provincial list, pending further consideration.

National General Status Ranks – Nova Scotia

See definitions for Canada above.

AC CDC (NatureServe) Subnational Ranks – Nova Scotia

See definitions for Global above, but subnational ranks are given with an 's' prefix.

Residence Status

Developed by ADIP, residence status is a metric of the nature of a species' presence in a water body or wetland, based on the degree to which it has been indicated or proven that the larvae of the species develop successfully to emergence.

- 1 Emergence recorded;**
 - directly observed,
 - collection of exuvia, or,
 - teneral on its maiden flight near the site.
- 2 Larvae collected,** unambiguous determination.
- 3 Laying observed.**
- 4 Mating observed.**
- 5 Reproductive behavior observed;**
 - male display for female,
 - male priming (transferring semen to secondary genitalia), or,
 - male towing female (an indicator of laying).
- 6 Males and females observed,** at the aquatic habitat appropriate for the species.
- 7 Females only observed,** at appropriate aquatic habitat.
- 8 Males only observed,** at appropriate aquatic habitat.
- 9 Not encountered at an appropriate aquatic habitat.**
- 10 Not encountered at any aquatic habitat.**

Abundance Codes

Developed by ADIP, these codes are an estimate of the number of individuals of the species seen in each record. The number range is used in the site accounts, the letter code in the Nova Scotia Species list.

- 1** A 1 individual seen.
- 2–5** B 2 to 5 individuals seen.
- 6–25** C 6 to 25 individuals seen.
- >25** D more than 25 individuals seen.

Adults of the insect order Odonata are of one of the most ancient and widely-recognized groups of insects – with very few exceptions they are identifiable to suborder even by children.

Taxonomy

The suborder Zygoptera comprises the damselflies; very slim, with eyes widely separated on a short head, and wings of similar shape generally held together over the back when perched.

The suborder Anisoptera comprises the dragonflies; which tend to be larger and more robust, and which hold their differently-shaped fore and hindwings more or less flat out to the side when perched.

History of Study

There has been an extraordinary surge in interest in odonates in the last twenty years – fueled in part by the availability of photographs of these brilliantly-coloured insects and the publication of field guides, but also by increased interest in rare and endangered species among conservation and government authorities.

In the northeast of North America, this interest was first manifested in the formation of volunteer surveys – ADIP (Atlantic Dragonfly Inventory Program) in Atlantic Canada, and MDDS (Maine Damselfly and Dragonfly Survey). Based on these largely volunteer efforts, government and conservation authorities have begun supporting studies, and odonates are now often included in environmental assessments.

Much remains to be done before we have a firm body of knowledge upon which to base assumptions in the region – however the 58,000 records in hand for Acadia (Maritime Provinces and Maine) are a substantial baseline for further work.

Listing

See Appendix 1 for status definitions.

Until recently the NatureServe listing for the Maritime Provinces was not complete on the subnational (provincial) level – recent efforts by the Atlantic Canada Conservation Data Centre have addressed that.

Recently, the odonates of Canada were assigned statuses in the National General Status structure, as were species in all provinces and territories.

The Nova Scotia Department of Natural Resources uses a system of colour statuses which largely reflects the National General Status definitions.

Significance to Humans

The order is an important component in all freshwater aquatic habitats – as predators high on the aquatic foodchain they consume many organisms we consider injurious, and are prey for many others we value.

They are, in particular, an important brake on the abundance of the aquatic biting insects.

Impacts on Odonata

Human impacts on odonates are principally those from aquatic habitat alteration, and tend to favour the common species over those rarer in the natural environments. On the positive side, we have constructed ponds, reservoirs, bogs and ditches which generally house good lists of lentic (slow-water) species. The formation of bogs has been particularly beneficial to northern species. On the negative side, we have greatly altered and in some cases eliminated all sizes of lotic (running water) habitats, and as a result have negatively impact many of those species which are obligate to those habitats.

Direct impacts are confined to collection for scientific purposes and road-kill. The latter can be a powerful impact on species depending upon their flying characteristics, however the former is rarely intense enough to endanger even the most restricted species population.

Lifestages

Odonata are largely aquatic insects, spending their infancy in the water. Unlike many aquatic insects, their larvae breathe the water (rather than taking their breath from the surface) and are hence vulnerable to a degree to changes in water chemistry. The larvae molt up to fourteen times during their development in the water, leaving molts or castoffs behind.

After a maturation period, variable by species, they emerge into the teneral lifestage, leaving the empty shell of the larva behind (called an exuvia). The teneral is soft-bodied and does not generally have the brilliant colours of the adult. When a teneral is taken with its exuviae it is called 'associated'.

After a period away from the water spent foraging and firming up, they return to their breeding arenas (usually at the water's edge).

Mature adults may be significantly different in colour and pattern from their tenerals, and in some groups there is considerable sexual dichromatism.

Behaviour

Major behaviours observed informed the establishment of residence status (see Appendix 1), and are: emergence (a teneral leaving its larval form), mating and towing (indicative of laying), laying, males fighting (indicative of territoriality at a larval habitat), nuptial (reproductive behaviour), wandering (an adult thought to be foraging away from its normal larval habitat).

SOIL

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix		Redox Features		Type ¹	Loc ²	Texture	Remarks
	Color (moist)	%	Color (moist)	%				
0-40-0							Organic Peat	

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators:

- ☒ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Stratified Layers (A5)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Depleted Dark Surface (F7)
- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Polyvalue Below Surface (S8)
- ☐ Thin Dark Surface (S9)
- ☐ Loamy Mucky Mineral (F1)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Redox Depressions (F8)
- ☐ Red Parent Material (TF2)

Indicators for Problematic Hydric Soils³:

- ☐ Sandy Gleyed Matrix (S4)
- ☐ Coast Prairie Redox (A16)
- ☐ 5 cm Mucky Peat or Peat (S3)
- ☐ Iron-Manganese Masses (F12)
- ☐ Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if observed):

Type: _____
Depth (inches): CM

Hydric Soil Present? Yes ☒ No ☐

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

- ☐ Surface Water (A1)
- ☒ High Water Table (A2)
- ☒ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9)
- ☐ Aquatic Fauna (B13)
- ☐ Marl Deposits (B15)
- ☐ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres on Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Thin Muck Surface (C7)
- ☐ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- ☐ Surface Soil Cracks (B6)
- ☐ Drainage Patterns (B10)
- ☐ Moss Trim Lines (B16)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Stunted or Stressed Plants (D1)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ Microtopographic Relief (D4)
- ☐ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ☐ No ☒ Depth (inches): CM
Water Table Present? Yes ☒ No ☐ Depth (inches): 15cm
Saturation Present? Yes ☒ No ☐ Depth (inches): 0
(Includes capillary fringe)

Wetland Hydrology Present? Yes ☒ No ☐

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM – NOVA SCOTIA

Project/Site: GRCW Municipality/County: Guy'sborough Sampling Date: Sept. 3/10
 Applicant/Owner: Eschmum Sampling Point: WL14-WP1
 Investigator(s): S. Purkey Section, Township, Range: Blacks Point
 Landform (hillslope, terrace, etc.): Depression Local relief (concave, convex, none): Hummocky
 Slope (%): 2% East: 644869 Long: 5023348 Datum: NAD 83 UTM
 Soil Map Unit Name: Rockland Wetland Type: Tropical Swamp
 Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No ☐ (If no, explain in Remarks.)
 Are Vegetation ☐, Soil ☐, or Hydrology ☐ significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No ☐
 Are Vegetation ☐, Soil ☐, or Hydrology ☐ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	Is the Sampled Area within a Wetland?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>
Hydric Soil Present?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>	If yes, optional Wetland Site ID: <u>WL14</u>	
Wetland Hydrology Present?	Yes <input checked="" type="checkbox"/> No <input type="checkbox"/>		
Remarks: (Explain alternative procedures here or in a separate report.)			

VEGETATION – Use scientific names of plants.

Appendix D.1

Watercourse Assessment Forms

of

Stream/River No.
Stream Order No.

Stream Type						Channel Type	Substrate	Flow Type	Pool Rating (reverse side)	
Fastwater		Pools							Criteria (No.)	% of Pools in Site (Letter)
1. Fall	6. Sheet (ledge)	10. Midchannel	14. Trench	18. Eddy	22. Wood Debris	1. Main (if measurement refers to main area of river)	1. Bedrock, Ledge 2. Boulder = > 461 mm 3. Rock = 180 - 460 mm 4. Rubble = 54 - 179 mm 5. Gravel = 2.6 - 53 mm 6. Sand = 0.08 - 2.5 mm 7. Fines = 0.0005 - 0.05 mm	1. Survey Stream 2. Spring 3. Brook/River Tributary 4. Spring Seep	Pool Depth > 1.5 m 1 - Instream Cover > 30% 2 - Instream Cover < 30% Pool Depth .5 to 1.5 m 3 - Instream Cover 5 - 30% 4 - Instream Cover > 30%	a - > 30% b - 10% to 30% c - < 10% a - > 50% b - < 50%
2. Cascade	7. Chute	11. Convergence	15. Plunge	19. Gabion	23. Man-Made Dam	* 2. Side Channel (water diverted by islands)				
3. Riffle (GR/RB)	8. Run	12. Lateral	16.	20. Log Structure	24. Natural Deadwater	* 3. Split (if river is split into various different stream types)				
4. Riffle (R/B)	9. Rapid	13. Beaver	17. Bogan	21. Road Crossing		* 4. Bogan				
5. Riffle (Sand)						* - Specify Left (L), Right (R) or Middle (M)				

[illegible]

WATER FLOW MEASUREMENT

RIFLE GRADIENT			UNIT No.	STREAM TYPE	WET WIDTH (m)	DEPTH (cm)			AVERAGE DEPTH SUM / 4		COEFFICIENT (0.9 - smooth) (0.8 - rough)	LENGTH (3m)	FLOAT TIME (sec)				FLOW cm/s
LENGTH M	DROP M	GRADIENT %				1/4 way	1/2 way	3/4 way	CENTIMETERS	METERS (m)			1/4 way	1/2 way	3/4 way	AVERAGE	

Where: W = width, D = depth, L = length, A is a coefficient for the stream bottom (A= 0.8 for rough bottom; 0.9 for smooth).

CRITERIA:	
1. Chute - water depth equal to or greater than channel width 2. Riffle - CR/B - is a riffle flowing over a gravel and/or rubble bottom R/B - is a riffle flowing over & through large substrates (e.g. rock and/or boulder), some of which protrudes the surface 3. Side channels - treat as a separate stream type	4. Undercut Bank - % of bank overhang (above water edge for stream type. Specify left (L) or right (R) 5. Over-hanging Bank Vegetation - % of vegetation overhang for stream type. Specify L or R 6. Visual Embeddedness - % of sands or fines surrounding the larger substrates, up to 100% 7. Woody Debris - total width should be >10 cm in diameter

Table E.1-7. List of Species Observed during Video Transect Survey of Benthic Habitat off Black Point, September 2010.

Marine Fauna	
American Oyster	<i>Crassostrea virginica</i>
Barnacle	<i>Semibalanus balanoides</i>
Blue Mussel	<i>Mytilus edulis</i>
Bowerbank's Halichondria	<i>Halichondria bowerbanki</i>
Cunner	<i>Tautogolabrus adspersus</i>
Frilled Anemone	<i>Metridium senile</i>
Green Sea Urchin	<i>Strongylocentrotus droebachiensis</i>
Lobster	<i>Homarus americanus</i>
Periwinkle	<i>Littorina sp.</i>
Scallop	<i>Placopecten magellanicus</i>
Sea Cucumber	<i>Cucumaria frondosa</i>
Sea Peach	<i>Holacynthia pyriformis</i>
Sea Star	<i>Asterias sp.</i>
Shorthorn Sculpin	<i>Myoxocephalus scorpius</i>
Waved Whelk	<i>Buccinum undatum</i>
Marine Flora	
Black Whip Weed	<i>Chordaria flagelliformis</i>
Bladderwrack	<i>Fucus sp.</i>
Brown alga	<i>Pilayella littoralis</i>
Encrusting Red Alga	<i>Leptophyllum sp.</i>
Green Alga	<i>Acrosiphonia arcta</i>
Green Fleece	<i>Codium fragile</i>
Irish Moss	<i>Chondrus crispus</i>
Kelp	<i>Laminaria saccharina</i>
Red Alga	<i>Plumaria plumosa</i>
Sea Colander	<i>Agarum clathratum</i>
Tube Weed	<i>Polysiphonia lanosa</i>

¹ denotes Canadian Council of Ministers for the Environment (CCME) Canadian Environmental Quality Guidelines - Sediment Quality Guidelines, revised 2002.

² denotes Canadian Council of Ministers for the Environment (CCME) Canadian Environmental Quality Guidelines - Soil Quality Guidelines, revised 2008.

³ Total PAH calculation based on the sum of 16 PAH compounds (acenaphthene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluorene, fluoranthene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene, and pyrene) as per guidance from Environment Canada, 2009.

⁴ denotes Index of Additive Cancer Risk (IACR) = ([Benzo(a)anthracene]/0.33mg/kg) + ([Chrysene]/2.1mg/kg) + ([Benzo(b+j)fluoranthene]/0.16mg/kg) + ([Benzo(k)fluoranthene]/0.034) + ([Benzo(a)pyrene]/0.37mg/kg) + ([Indeno(1,2,3-c,d)pyrene]/2.7mg/kg) + ([Dibenz(a,h)anthracene]/0.23mg/kg) + ([Benzo(g,h,i)perylene]/6.8mg/kg).

⁵ denotes Total Potency Equivalent (TPE) SQG based on an incremental lifetime cancer risk (ILCR) of 1 in 100,000 (10⁻⁵).

⁶ "NA" denotes the Benzo(a)pyrene TPE has not been multiplied by an uncertainty factor (UF) of 3 as results from the lab indicate there is no evidence of creosote in the sample.

NOTE: All results below the laboratory detection limit were divided by 2 prior to further calculations.

OC Pesticides and PCBs in Soil

DATE SAMPLED: Sep 01, 2010

DATE RECEIVED: Sep 02, 2010

DATE REPORTED: Sep 15, 2010

SAMPLE TYPE: Soil

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

1971606 Results are based on the dry weight of the soil.
Due to the high moisture content the sample was air dried prior to extraction.

1971621-1971639 Results are based on the dry weight of the soil.
Due to the high moisture content the sample was air dried prior to extraction.
Sample was diluted and Reporting Detection Limit raised due to chromatographic interference.

1.0 INTRODUCTION

Vulcan Materials Company and Morien Resources Corp. (the Proponent) proposes the development, operation, decommissioning and abandonment of a granite quarry and marine terminal at Black Point in Guysborough County, Nova Scotia. The Black Point Quarry Project consists of aggregate production (drilling, blasting, processing and stockpiling) on a 354.5 ha property, along with the construction and operation of a 200 m long marine terminal adjacent to the quarry in Chedabucto Bay. The aggregate will be loaded into bulk carriers up to 70,000 DWT and transported to ports along the US eastern and Gulf coasts and potentially to markets in Canada and the Caribbean.

1.1 Project Area

The Black Point Quarry Project (the Project) is located on the south shore of Chedabucto Bay in the District of Guysborough, Nova Scotia. The proposed Project Site is approximately 2 and 2.5 km from the communities of Half Island Cove in the west, and Fox Island Main in the east, respectively. The Project is situated between Highway 16 and the Atlantic coast in an area dominated by coniferous forests, coastal barrens, as well as various types of wetlands including, bog, fen, swamp and marsh. A power transmission line corridor runs along the south end of the property and with the exception of a few ATV trails, skidder tracks and property cut lines, the area is relatively undisturbed.

1.2 Scope of Work

In preparation for construction activities planned within the Black Point Quarry Project boundary, wetlands located within the Project area must be identified, delineated and assessed in terms of ecological functions they provide. This work is required to determine the potential impacts the Project may have on wetland habitat. The information will also be used to prepare wetland alteration applications to NSE and associated plans for wetland compensation. The following activities were conducted to identify and delineate wetland habitat present:

- Review aerial photographs and existing maps to identify location of wetlands;
- Determine wetlands in the field using three parameter approach (soil, vegetation, and hydrology);
- Mark wetland boundaries with physical markers and GPS;
- Conduct wetland habitat and functional assessments; and
- Reporting including photographs and field data sheets.

2.0 WETLANDS REGULATORY REQUIREMENT AND DEFINITIONS

Several definitions of “wetland” exist in literature:

- Lands that are seasonally or permanently covered by shallow water, including lands where the water table is at or close to the surface. The presence of abundant water causes the formation of hydric soils and favours the dominance of either hydrophytic or water-tolerant plants. The five major types of wetlands are: marshes, swamps, bogs, fens and shallow open waters (Environment Canada, 2013);
- A wetland is land “where the water table is at, near, or above the surface or which is saturated for a long enough period to promote such features as wet-altered soils and water tolerant vegetation” (Environment Canada, 1996);
- A wetland is land that is “saturated with water long enough to promote wetland or aquatic processes as indicated by poorly drained soils, hydrophytic (i.e., water-loving) vegetation and various kinds of biological activity which are adapted to a wet environment” (Government of Canada, 1991); and
- Wetlands are areas of “marsh, fen, peatland or water, whether natural or artificial, permanent or temporary, with water that is static or flowing, fresh, brackish or salt, including areas of marine water the depth of which at low tide does not exceed six meters” (UNESCO, 1987).

Although each definition is slightly different, the relevant common aspects adopted for the purpose of this report that define a wetland are:

- Land that is saturated or covered by water for some time during the growing season;
- Poorly drained soils; and
- Predominantly, hydrophytic vegetation.

From these features that define a wetland, it is clear that preserving wetland habitat is dependent on maintaining existing soil, vegetation, and hydrologic conditions at a site.

Wetlands are environmentally significant for several reasons, including: water filtration; water storage (water recharge); flood reduction and control; carbon absorption; erosion control; and wildlife habitat (Nova Scotia Museum, 1996). Loss of wetlands has resulted, to some degree, in increased flooding, decreased water quality, desertification, and declines of fish and wildlife (Lynch-Stewart, 1992).

2.1 Federal Policy on Wetland Conservation

The *Federal Policy on Wetland Conservation* (Government of Canada, 1991) directs all federal government departments to conserve or sustain wetland functions during delivery of their programs. One of the main considerations in developing the Policy was Canada’s membership in the Ramsar Convention on Wetlands (Revised 1987), signed by Canada in 1981. The Ramsar Convention is a global conservation treaty specifically dealing with wetland loss and sustainable use.

Another consideration in developing the Policy was Canada's commitments under the North American Waterfowl Management Plan and the potentially beneficial influences of land use decisions by federal departments and agencies (Lynch-Stewart *et al.*, 1999).

The two key commitments in the federal wetland policy include:

- No net loss of wetland functions on federal lands through mitigation; and
- Enhancement and rehabilitation of wetlands in areas where wetland loss has reached critical levels.

Implementation of strategies contained in the Federal Policy on Wetland Conservation is outlined in the *Implementation Guide for Federal Land Managers* (Lynch-Stewart *et al.*, 1996). The Guide also outlines the hierarchy for mitigation alternatives for meeting the goal of no net loss of wetland function:

- First – Avoid impacts;
- Second – Minimize unavoidable impacts; and
- Third, and last – Compensate for residual impacts that cannot be minimized.

In addition, the Guide provides advice on integrating wetlands into the project planning process, and details on the related process under the *Canadian Environmental Assessment Act 1992*.

2.2 Nova Scotia Wetland Policy

The *Nova Scotia Wetland Conservation Policy* (NSE, 2011) provides direction with respect to conservation, alteration or infilling of wetlands in Nova Scotia. The guiding principle is to achieve no loss in Wetlands of Special Significance and prevent net loss of wetland function in other wetlands. The Department designates infilling or alteration of wetlands as an "activity" under the *NS Environment Act* (Government of Nova Scotia, 1995) and requires approval of such activities prior to the occurrence.

This Policy recognizes that freshwater wetlands and salt marshes are critical ecosystems that provide a suite of environmental and societal services including:

- Maintaining watershed health;
- Maintaining and improving water quality and quantity (surface and groundwater);
- Reducing impacts and damage due to flooding and storm surges;
- Providing habitat for wildlife and other wetland dependent species; and
- Providing opportunities for recreation and education.

Nova Scotia Environment (NSE) recognizes that wetlands are a particularly sensitive habitat and that alteration of wetlands can cause significant adverse environmental effects. The policy guides departmental decision making with respect to wetlands.

3.0 METHODOLOGY

3.1 Desktop Review

All wetlands noted to occur within the Project footprint from previous reports and databases, were mapped, and information on the location, size and type of these wetlands were extracted. This information has been augmented by information obtained from review of:

- NS Wetlands Atlas
- Aerial photos;
- Topographical maps;
- NSDNR Wet Areas Mapping (WAM); and
- Information collected during field work.

All known wetland locations as well as high potential areas identified during the desk top review were visited in the field to confirm the presence of wetland habitat within the Project area.

3.2 Wetland Delineation

Wetland delineations were conducted by trained wetland biologists according to standard methodologies approved by NSE (NSE, 2013). The determination of wetland habitat in the field was based largely on the Corps of Engineers Wetland Delineation Manual (the Manual) (Environmental Laboratory, 1987) and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual (USACE, 2012). Wetland areas within the Project area were identified and mapped using wetland indicators and definitions from the delineation approach approved by NSE (NSE, 2013). This consisted of using representative “paired data points” (i.e., one sample point in the wetland habitat and one sample point in the adjacent upland habitat) as described in the US Army Corps of Engineers Manual.

Wetland data were recorded on Wetland Delineation Data Sheets developed by the Maritimes College of Forestry Technology for the province of Nova Scotia (Appendix A). *Munsell Soil Color Charts* were used to aid in identifying hydric soils in the field. The *Canadian System of Soil Classification* (SCWG, 1998) was used to aid in description of soil characteristics. The *Roland's Flora of Nova Scotia* (Zinc, 1998) and *Flora of New Brunswick* (Hinds, 2000) aided with plant nomenclature and identification. The location of data points and selected wetland boundary points were recorded by Global Positioning System (GPS) using a TRIMBLE Geo-XH GPS receiver capable of sub-metre accuracy. Accuracy of all saved data points were estimated by the receiver to be <1m.

At each sample site, two sample points were chosen; which represent wetland and upland habitat at the wetland boundary. The location of each sample point was recorded with the GPS and marked using pink flagging tape with a unique GPS waypoint name (See Appendix B). The identified vegetation communities were then used to delineate the wetland boundary. Wetland boundary locations were recorded with the GPS and used to prepare individual wetland figures located at the end of this report. Representative site photos of wetland areas, adjacent upland areas, and soil pit exposures were also collected (Appendix C).

3.3 Wetland Determination

To be determined a wetland; the following three criteria should be met:

- Majority of dominant vegetation species are wetland associated species;
- Hydrologic conditions exist that result in periods of flooding, ponding, or saturation during the growing season; and
- Hydric soils are present.

3.3.1 Vegetation

Hydrophytic vegetation is defined as the sum total of macrophytic plant life that occurs in areas where the frequency and duration of inundation or soil saturation produce permanent or periodically saturated soils of sufficient duration to exert a controlling influence on the plant species present (Environmental Laboratory 1987). The definition of wetlands includes the phrase "sustains aquatic processes as indicated by the presence of hydric soils, hydrophytic vegetation and biological activities adapted to wet conditions." Hydrophytic vegetation should be the dominant plant type and is characterized by the dominant plant species comprising the plant community (Environmental Laboratory 1987).

Dominant plant species observed at each data point were classified according to their Indicator Status Group (probability of occurrence in wetlands) (Table 3.1), in accordance with the Nova Scotia Wetland Indicator Plant List developed by Sean Blaney at the Atlantic Canada Conservation Data Center (ACCDC, 2011). This classification of plants follows methods developed by the US fish and Wildlife Service (Reed 1988). Further relevant information was reviewed in Roland's *Flora of Nova Scotia* 3rd Ed. (Zinc, 1998) and *Flora of New Brunswick* 2nd Ed. (Hinds, 2000).

Table 3.1: Classification of Wetland-Associated Plant Species

Plant Species Classification	Abbreviation	Probability of Occurring in Wetland
Obligate	OBL	>99%
Facultative Wetland	FACW	66-99%
Facultative	FAC	33-66%
Facultative Upland	FACU	1-33%
Upland	UPL	<1%
No indicator status	NI	Insufficient information to determine status
Plants That Are Not Listed (assumed upland species)	NL	Does not occur in wetlands in any region.

Source: USFWS 1988.

The Prevalence Index (PI) was the main indicator used to assess the dominance of hydrophytic vegetation at each data point location. The PI method assigns weighted values to each dominant species according to their Indicator Status Group. The total cover (% area) of species

in each group is then multiplied by the weighted values and the product is divided by the sum of the unweighted total cover, yielding a value between 1 and 5. If the majority of the dominant vegetation on a site are classified as obligate (OBL), facultative wetland (FACW), or facultative (FAC) then the PI will be equal to or less than 3, and the site is considered to be dominated by hydrophytic vegetation.

3.3.2 Soils

A hydric soil is defined as a soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part (USDA-NRCS, 2007). Indicators of hydric soil include; soil color (gleyed soils and soils with bright mottles and/or low matrix chroma), aquic or preaquic moisture regime, reducing soil conditions, sulfidic material (odour), soils listed on hydric soils list, iron and manganese concretions, organic soils (Histosols), histic epipedon, high organic content in surface layer in sandy soils, and organic streaking in sandy soils.

A soil pit was excavated to a minimum depth of 40 centimetres or refusal at each data point. The soil was then examined for hydric soil indicators. The matrix color and mottle color (if present) of the soil was determined using the Munsell Soil Color Charts.

3.3.3 Hydrology

Wetlands, by definition, either periodically or permanently have a water table at, near or above the land's surface or are saturated with water. To be classified as a wetland, a site should have at least one primary indicator or two secondary indicators of wetland hydrology. Primary indicators of wetland hydrology may include, but are not limited to: water marks, drift lines, sediment deposition, drainage patterns, visual observation of saturated soils, and visual observation of inundation. In addition to the primary indicators, there is a variety of secondary wetland hydrology indicators. Secondary indicators include, but are not limited to: oxidized root channels in the upper 12 inches (30.5 centimetres), stunted vegetation, and local soil survey data. When no primary indicators of wetland hydrology are observed at a data point, two or more secondary indicators are required to confirm wetland hydrology.

3.3.4 Regional Supplement

There are a number of uncommon situations, often regional in nature that may cause difficulty in interpreting wetland indicators at a site. Some examples include recent disturbance (e.g. vegetation clearing, infilling), past land use (e.g. agricultural tillage or ditch drainage), recent extreme flooding (e.g. sediment deposits, hanging debris), and problematic soils (e.g. fluvial deposits, red parent material). The Interim Regional Supplement to the Corps of Engineers Wetland Delineation Manual (USACE, 2012) contains specific guidance for use in these situations. Although there was some minor disturbance noted in some of the wetlands assessed within the Project area, none were considered to be problematic in terms of interpreting wetland indicators.

3.4 Functional Assessment Method

Environment Canada and the US Army Corps of Engineers both describe wetland ecological functions as the natural processes (physical, chemical, biological) that a wetland provides that is independent from the benefits these processes provide to humans (Hanson et al., 2008; USACE, 1999). This is differentiated from wetland values which reflect the ecosystem services wetlands provide to humans and the associated societal value. These “values” are a product of the ecological function a wetland may provide, but may change depending on individual or community preference (Hanson et al., 2008).

NSE has developed the Nova Scotia Wetland Evaluation Technique (NovaWET) which is designed to assess the condition and functions of wetlands specifically in Nova Scotia (NSE 2014). This technique has been adapted using aspects of various methods successfully employed in other regions, in particular the US. This method uses a combination of landscape level information and site-specific characteristics of the wetland to determine the most significant wetland functions.

NovaWET consists of 11 major sections associated with key wetland functions. Each section contains a number of questions that pertain to that function which provide details that enable the assessor to determine to what degree the wetland provides significant functions (SF). This method identifies a total of 29 significant functions a wetland may provide depending on the specific characteristics of the wetland and surrounding landscape. The 11 major sections and associated 29 significant functions are as follows:

- Section 1 – Watershed Characteristics
 - SF1 – Watershed condition
 - SF2 – Proportion of wetland area in watershed & opportunity for floodwater detention
- Section 2 – Wetland Characteristics
 - SF3 – General wetland condition/integrity
- Section 3 – Adjacent Land Condition and Integrity
 - SF4 – Overall condition and integrity of adjacent land to wetland
- Section 4 – Documented Important Features
 - SF5 – Wetland is a WSS
 - SF6 – Wetland support commercial/recreational fish/shellfish
 - SF7 – Wetland contains/ is utilized by species of concern
 - SF8 – Wetland has conservation/compensation agreement/activity
 - SF9 – Wetland is calcareous fen, black ash or cedar swamp
 - SF10 – Wetland is situated within Drinking Water Protected Area (designated watershed/wellfield)

- SF11 –Wetland is situated within a floodplain and upstream or within a populated area
- SF12 – Wetland is situated within Fed/Prov/Municipal area of interest
- Section 5 – Hydrologic Condition and Integrity
 - SF13 – Wetland hydrologic condition
 - SF14 – Wetland importance for maintaining stream flow
 - SF15 – Wetland ability to detain surface water
- Section 6 – Water Quality
 - SF16 – Wetland improves water quality
 - SF17 – Evidence of excess nutrient loading/contamination
 - SF18 – Wetland contributes to water quality in downstream resources
- Section 7 – Groundwater Interactions
 - SF19 – Wetland likely a recharge site
 - SF20 – Wetland likely a discharge site
- Section 8 – Shoreline Stabilization and Integrity
 - SF21 – Wetland ability to stabilize shoreline
- Section 9 – Plant Community
 - SF22 – Plant community unique or rare regionally or provincially
 - SF23 – Wetland contains a diversity of plant communities
 - SF24 – Overall integrity of the wetland's plant community
 - SF25 – Presence of rare or endangered plant species
- Section 10 – Fish and Wildlife Habitat and Integrity
 - SF26 – Wetland supports fish/fish habitat
 - SF27 – Presence of rare or endangered fish/wildlife
 - SF28 – Wetland's overall fish and wildlife habitat quality
- Section 11 – Community Use/Value
 - SF29 – Wetland's community use/value

NovaWET goes further to identify critical wetland functions (SF rating highlighted in red on the data sheets) that are often unique or rare or associated with high risk to the watershed if lost and as such minimizing or compensating for this loss may be difficult. In many cases the rating of significant functions determines whether the wetland provides a critical function or if this function is just merely present. For example a wetland is considered to provide a critical function as fish and wildlife habitat if that significant function is assessed to be of high quality.

Alternatively, if habitat quality is determined to be low or moderate, the wetland is still considered to offer that function, however it is not considered critical. Other significant functions only need to be present in order to be considered critical for example the presence of a rare or endangered species constitutes a critical function for that wetland. NSE should be consulted should a wetland be determined to provide a critical wetland function prior to Project implementation.

Functional Assessments of all wetlands encountered within the Project area were conducted using the NovaWET method. Appendix D provides the completed NovaWET evaluation forms for the 22 wetlands assessed within the Project area.

4.0 RESULTS

Preliminary field surveys were conducted between August 31st and September 8th, 2010 by AMEC Wetland Biologists, Scott Burley (M.Sc.) and Marion Sensen (Ph.D.). During this initial round of surveys, wetland habitat occurring within the Project Area was identified in the field, approximate boundaries were determined and habitat assessments were conducted. The purpose of this round of surveys was to provide an overview of the amount and type of wetland habitat present on the Project Site to aid in planning and design of specific Project components.

A second round of wetland surveys was conducted in July of 2011 by Pinchin LeBlanc Wetland Biologist, Theo Popma. During this second survey, wetland delineations were conducted following standardized methodologies described above (Sections 3.2 and 3.3).

A third and final round of field surveys was conducted by Scott Burley and Marion Sensen between August 18th and August 22nd, 2014. The weather during these surveys was a mix of sun and cloud with rain on the 18th. Wetland delineations were verified in the field and additional field data was recorded for each wetland to be used during the functional assessments.

A total of 22 wetlands were identified within the Project footprint and/or determined to be hydrologically connected downstream. The majority of wetland habitat identified consists of open bogs and riparian fens which range in size from approximately 16.5 ha to <0.5 ha. Other wetland types identified include swamp and marsh as well as complexes including a combination of a number of these wetland types. The total area of wetland habitat identified within the Project Study Area is approximately 57 ha.

Individual wetlands identified during the initial 2010 surveys were given a unique wetland identifying number. These wetland numbers were recorded on all data sheets completed during the 2010 and 2011 surveys. Over the course of the next two field survey events, wetland boundaries were refined and verified and as such some wetlands identified as individual wetlands in 2010 were subsequently found to be connected, forming larger wetland complexes. In these instances data collected for each wetland component were combined and the wetland complex was assigned a new wetland identifying number that fits chronologically with the actual number of wetlands occurring within the Project Area. Table 4.1 below presents the updated

wetland numbering system along with the corresponding initial numbering system that is reflected in the field data sheets. Note that the functional assessment forms in Appendix D reflect the updated numbering system.

Twelve (12) of the 22 wetlands surveyed were found to occur directly within the proposed footprint of the pit, fill areas and plant location (WL1, WL3 – WL7 and WL11-WL15 inclusive in Table 4.2). Four (4) wetlands surveyed occur within the proposed footprint of the access road (WL12- WL20 inclusive). Six (6) wetlands surveyed (WL8-WL10, WL16, WL21 and WL2) are situated outside the proposed footprint of all Project components however these wetlands may be indirectly impacted by the project and as such were included in the surveys. Complete wetland delineation, habitat assessments and functional assessments were conducted for all 22 wetlands surveyed.

Table 4.2 provides a summary of all wetlands assessed along with their general characteristics and corresponding coordinates (UTM Zone 20, NAD 83).

Table 4.2: Wetland Locations and Characterization

Wetland #	Coordinates		Type	Size (Ha)	Landscape Position	Water Flow Path	Landform
	Easting	Northing					

1	645437	5022529	Bog/Swamp Complex	16.5	Lotic Stream	Throughflow	Basin
2	645430	5024058	Fen/Swamp/Marsh Complex	6	Lotic Pond	Inflow	Basin
3	645076	5024059	Riparian Fen	0.5	Lotic Stream	Throughflow	Slope
4	645076	5024059	Bog	0.2	Terrene	Isolated	Basin
5	644431	5024129	Riparian Fen	0.5	Lotic Stream	Throughflow	Slope
6	644737	5024077	Bog	0.3	Terrene	Outflow	Basin
7	644845	5024349	Riparian Treed Swamp	0.5	Lotic Stream	Throughflow	Slope
8	644009	5023134	Swamp/Bog/Fen Complex	10.3	Lotic Stream	Throughflow	Flat
9	643617	5023397	Bog	4.6	Terrene	Isolated	Flat
10	643857	5023694	Riparian Treed Swamp	0.1	Lotic Stream	Throughflow	Slope
11	644458	5023456	Bog	9.0	Terrene	Isolated	Flat
12	644737	5024077	Bog/Fen Complex	0.3	Terrene	Outflow	Basin
13	644860	5023362	Treed Swamp	0.6	Terrene	Isolated	Slope
14	645506	5023190	Fen/Bog Complex	6.2	Lotic Stream	Throughflow	Slope
15	645265	5023544	Riparian Fen	0.07	Lotic Stream	Throughflow	Slope
16	645920	5022505	Bog	0.45	Terrene	Isolated	Basin
17	644193	5021827	Bog/Swamp Complex	0.74	Terrene	Outflow	Basin
18	644396	5022050	Bog	0.07	Terrene	Isolated	Basin
19	644440	5022148	Bog	0.04	Terrene	Isolated	Basin
20	644447	5022225	Bog	0.15	Terrene	Isolated	Basin

22	645630	5023728	Riparian Fen	0.1	Lotic Stream	Throughflow	Slope
Total Wetland Area (ha)				57.3			

4.1 Wetland Delineation

The following descriptions of sample test points are summarized from field data sheets presented in Appendix A. Site photos are included in Appendix C. The following description refers to GPS points in Appendix B and figures located at the end of this report. In addition to the sample test pit locations summarized below, additional supplemental test pits were completed and summarized on Appendix E.

4.1.1 Wetland 1 (WL1)

WL1 (Figure 3) is a fen/bog/swamp wetland complex approximately 16.5 ha in total area located in the southeast end of the Project Area (Figure 2). This wetland was originally identified as

three separate wetlands (WL1, WL17 and WL18) however further field investigations identified that these areas are in fact connected to form one large complex. One paired sampling site was recorded (labeled as WL17 on data sheets in Appendix A). The wetland was determined to contain normal site conditions however the vegetation along the southern boundary is slightly influenced by maintenance activities within the power transmission line corridor. The upland area around surrounding the wetland consists of a mix of shrub barren and coniferous forest.

The dominant vegetation at Data Point "WL1-WP1" in the overstory is Black Spruce (*Picea mariana*) with Mountain Holy (*Nemopantes muronata*) and Wild Raisin (*Viburnum nudum*) dominating the shrub layer. The understory is dominated by a thick layer of sphagnum moss with Leather Leaf (*Chamaedaphne calyculata*) and Common Juniper (*Juniperus communis*) as the dominant understory (Photo 1; Appendix C). The PI was observed to be 2.4. The soil was determined to be a Balck Histic (A3) as there was 20 cm of organic matter accumulated over a loamy sand layer with color of 10YR 3/2 (Photo 2; Appendix C). Soil saturation was found to be at 3cm (A3) while no surface water or water table was detected.

The dominant vegetation at Data Point "WL1-UP1" in the overstory is Balsam Fir (*Abies balsamea*), Red Maple (*Acer rubrum*) and Black Spruce. Mountain Holy was found to be dominant in the understorey while Lambkill (*Kalmia angustifolia*) and Labrador Tea (*Ledum groenlandicum*) dominated the understory (Photo 3; Appendix C). The PI was observed to be 2.7. The substrate was found to consist of a 14 cm organic layer over rock (Photo 4, Appendix C). The soil appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Changes in topographic relief and vegetation were the main criteria utilized in delineating the wetland boundary. Along the northern, eastern and southern boundaries of the wetland there is a noticeable transition in elevation (~15% slope) and vegetation.

4.1.2 Wetland 2 (WL2)

WL2 (Figure 4) is a Marsh/fen/Swamp wetland complex approximately 6.0 ha in total area located in the northwest end of the Project area (Figure 2). One paired sampling site was recorded. The wetland was determined to contain normal site conditions however the vegetation in southern end of the site has been disturbed and is now an early successional forest. The upland area surrounding the south, east and west sides of the wetland are composed of a coniferous forest while the northern side is bordered by a cobble/boulder/sand beach.

The dominant vegetation at Data Point "WL2-WP1" in the overstory and subcanopy is Balsam Fir along with Lambkill and Mountain Holy dominating the shrub layer. The understory is dominated by a thick layer of sphagnum moss with Three-seeded Sedge (*Carex trisperma*), Creeping Snowberry (*Gaultheria hispidula*) and Three-leaved False Solomon's Seal (*Mainantheum trifolium*) as the dominant understory (Photo 5; Appendix C). The PI was

observed to be 2.6. The soil was determined to be a histosol (A1) as there was more than 40 cm of organic matter accumulated (Photo 6; Appendix C). Although surface water or the water table was not present at the sample point, soil saturation was at 15cm (A3) and a strong Hydrogen Sulfide odor was detected (C1).

Balsam fir and White Birch (*Betula papyrifera*) is the dominant vegetation at Data Point “WL2-UP1”, in the overstory while Balsam Fir, Lambkill and Mountain Ash (*Sorbus americana*) is also dominant in the subcanopy. Bunchberry (*Cornus canadensis*) and Wild Sarsaparilla (*Aralia nudicaulis*) were found to dominate the understory (Photo 7; Appendix C). The PI was observed to be 3.0 although all dominant species were found to have an indicator status of FAC. The substrate was found to consist of a 10 cm duff layer over a 7cm silt loam Ae layer (2.5YR 5/1) (Photo 8, Appendix C). The soil appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Delineation of WL2 relied primarily on an abrupt change in elevation and shift in vegetation composition. The wetland is located in a basin where the land slopes inward essentially on all sides. A small stream provides an inlet to the wetland on the southwest end.

4.1.3 Wetland 3 (WL3)

WL3 (Figure 5) is a riparian fen wetland approximately 0.5 ha in total area located in the northern end of the Project area (Figure 2). One paired sampling site was recorded. The wetland was determined to contain normal site conditions. The upland area surrounding the entire wetland is composed of a coniferous forest.

The dominant vegetation at Data Point “WL3-WP1” in the understory is Black Spruce and Larch (*Larix laricina*). The ground layer is dominated by a thick layer of sphagnum moss with Swamp-Pink (*Arethusa bulbosa*) and White Beak-rush (*Rhynchospora alba*) as the dominant species (Photo 9; Appendix C). The PI was observed to be 2.2. The soil was determined to be a histosol (A1) as there was more than 40 cm of organic matter accumulated (Photo 10; Appendix C). Although surface water was not present at the sample point, soil saturation was at surface (A3) and the water table was to 15 cm from surface (A2).

White Spruce (*Picea glauca*) is the dominant species at Data Point “WL3-UP1” in the overstory while Black Holly (*Ilex verticillata*) and Balsam Fir dominate the understorey. Wild lily-of-the-valley (*Mainantheum canadensis*), Star Flower (*Trientalis borealis*) and Mountain Cranberry (*Vaccinium vitis-idea*) was found to dominate the understory (Photo 11; Appendix C). The PI was observed to be 2.8 although all but one species recorded has an indicator status of FAC. The substrate was found to consist of a 15 cm duff layer over a sand silt Ae horizon (5Y 5/1) (Photo 12, Appendix C). The soil appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

WL3 is located in a steep sided basin where boundary delineation was determined primarily by the abrupt change in elevation and associated shift in plant species composition.

4.1.4 Wetland 4 (WL4)

WL4 (Figure 6) is a bog wetland approximately 0.2 ha in total area located in the northern end of the Project area (Figure 2). One paired sampling site was recorded. The wetland was determined to contain normal site conditions. The upland area along the perimeter of this wetland consists of coniferous forest.

The dominant vegetation at Data Point “WL4-WP1” is Black Spruce in the canopy and subcanopy while Three-leaved False Solomon’s Seal and Three-seeded Sedge are the dominant species in the understory (Photo 13; Appendix C). The PI was observed to be 1.9. The soil was determined to be a histosol (A1) as there was more than 40 cm of organic matter accumulated (Photo 14; Appendix C). Surface water was not found to be present at the sample point however soil saturation was at 5 cm (A3) and there was a strong Hydrogen Sulfide odor detected (C1).

Black Spruce is the dominant species at Data Point “WL4-UP1” in the overstory. Mountain Holly and Black Spruce dominated the understorey while Three-seeded Sedge and Lambkill were found to dominate the understory (Photo 15; Appendix C). The PI was observed to be 2.3. The substrate was found to consist of a 15 cm duff layer over a 9 cm silt Ae layer (2.5YR 7/1) (Photo 16, Appendix C). The soil appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

WL4 is located in a steep sided basin where boundary delineation was determined primarily by the abrupt change in elevation and associated shift in plant species composition.

4.1.5 Wetland 5 (WL5)

WL5 (Figure 7) is a riparian fen wetland approximately 0.5 ha in total area located in the southern end of the Project area (Figure 2). One paired sampling site was recorded. The wetland was determined to contain normal site conditions. The upland area along the south, east and north boundaries is composed of a coniferous forest while a cobble/boulder/sand beach is located at the west boundary.

The dominant vegetation at Data Point “WL5-WP1” is located in the understorey including Large Cranberry (*Vaccinium macrocarpon*), Tussock Cotton-grass (*Eriophorum vaginatum*) and Bog Aster (*Oclemena nemoralis*) (Photo 17; Appendix C). The PI was observed to be 2.2. The soil was determined to be a histosol (A1) as there was more than 40 cm of organic matter accumulated (Photo 18; Appendix C). Surface water was found to be present at the sample point (A1), soil saturation was at surface (A3) and the water table was to 5 cm from surface (A2).

Balsam Fir and White Spruce are the dominant species at Data Point “WL5-UP1” in the canopy. Speckled Alder (*Alnus incana*) is dominant in the understorey while Bunchberry and Spinulose Woodfern (*Dryopteris carthusiana*) was found to dominate the understory (Photo 19; Appendix C). The PI was observed to be 3.1. The substrate was found to consist of a 2 cm duff layer over a 35 cm sand loam B horizon (7.5YR 4/4) (Photo 20, Appendix C). The soil appeared to

be well drained with no presence of saturation. The lack of hydric vegetation, hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the north and south sides were determined by an abrupt change in elevation. The boundary along the eastern end of this wetland consists of a more gradual change in elevation which creates a wider transition from wetland to upland in this area. Wetland boundary in this area was determined by a shift in dominance of sphagnum moss in the wetland to feather moss in the upland. Wetland boundary in the west end was determined by the beach.

4.1.6 Wetland 6 (WL6)

WL6 (Figure 8) is a bog wetland approximately 0.3 ha in total area located in the northern end of the Project area (Figure 2). One paired sampling site was recorded. The wetland was determined to contain normal site conditions. The upland area surrounding this wetland consists of coniferous forest.

The dominant vegetation at Data Point “WL6-WP1” is Black Spruce and Balsam Fir in the canopy with Black Spruce, Huckleberry (*Gaylussacia baccata*) and Sweet Gale (*Myrica gale*) dominating the understorey. Three-leaved False Solomon’s Seal and Tussock Cotton-grass are the dominant species in the understory (Photo 17; Appendix C). The PI was observed to be 2.1. The soil was determined to be a histosol (A1) as there was 30 cm of organic matter overtop of bedrock (Photo 18; Appendix C). Although no surface water was found at the sample point, soil saturation was at surface (A3) and the water table was at 20 cm from surface (A2).

Balsam Fir is the dominant species at Data Point “WL6-UP1”, in the canopy and subcanopy while Wild Lily-of-the-valley, Mountain Cranberry, Twin Flower (*Linnaea borealis*) and Partridge Berry (*Mitchella repens*) dominate the understory (Photo 19; Appendix C). The PI was observed to be 3.0. The substrate was found to consist of a 5 cm duff layer over a sandy loam Ae layer (7.5YR 6/1) over a clay loam Bf horizon (7.5YR 4/6) (Photo 20, Appendix C). The soil appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the north and south sides were determined by an abrupt change in elevation. The boundaries along the eastern and western end of this wetland consist of a more gradual change in elevation which creates a wider transition from wetland to upland in this area. Wetland boundary in this area was determined by a shift in dominance of sphagnum moss in the wetland to feather moss in the upland.

4.1.7 Wetland 7 (WL7)

WL7 (Figure 9) is a Riparian treed swamp wetland approximately 0.5 ha in total area located at the northern end of the Project area (Figure 2). One paired sampling site was recorded. The wetland was determined to contain normal site conditions. The upland area along the western

boundary is a rock cliff leading the ocean while coniferous forest surrounds the remainder of the wetland.

The dominant vegetation at Data Point “WL7-WP1” is Black Spruce in the canopy and (Photo 21; Appendix C). The PI was observed to be 2.0. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated organic matter (Photo 22; Appendix C). Surface water was not found to be present however a strong Hydrogen Sulfide odor was detected (C1) and soil saturation was at 5 cm (A3).

White Spruce is the dominant species at Data Point “WL7-UP1” in the canopy while Lambkill, White Spruce and Green Alder (*Alnus crispa*) is the dominant species in the subcanopy while Bunchberry dominates the understory (Photo 23; Appendix C). The PI was observed to be 3.1. The substrate was found to consist of a 15 cm duff layer over rock (Photo 24, Appendix C). The soil appeared to be well drained with no presence of saturation. The lack of all three wetland indicators identifies this site as upland.

Wetland boundaries of WL7 were determined by an abrupt change in elevation and vegetation composition.

4.1.8 Wetland 8 (WL8)

WL8 (Figure 10) is a riparian swamp/bog/fen wetland complex approximately 10.3 ha in total area located in the western side of the Project area (Figure 2). One paired sampling site was recorded. This wetland was originally identified as two separate wetlands (WL8 and WL9 on data sheets on Appendix A) however further field investigations identified that these areas are in fact connected to form one large complex. The wetland was determined to contain normal site conditions. The upland habitat surrounding this wetland consists of a mix of barren vegetation, coniferous forest and mixed forest.

The dominant vegetation at Data Point “WL8-WP1” in the canopy is Balsam Fir and Red Maple. The subcanopy is dominated by Cinnamon Fern while Three-seeded Sedge dominates the understorey (Photo 25; Appendix C). The PI was observed to be 1.5. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated organic matter (Photo 26; Appendix C). Surface water was not found to be present however a strong Hydrogen Sulfide odor was detected (C1) and soil saturation was at 5 cm (A3).

The dominant species at Data Point “WL8-UP1” in the canopy is Balsam Fir and Red Maple. Dominant species in the subcanopy include Mountain Holy, Wild Raisin and Lambkill while Wild Sarsaparilla and Star Flower dominate the understory (Photo 27; Appendix C). The PI was observed to be 2.9. The substrate was found to consist of a 20 cm duff layer over 10 cm silt-loam Ae layer (2.5YR 5/1), over rock (Photo 28, Appendix C). The soil appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the bog portion of WL8 were determined by an abrupt change in elevation and associated shift in dominant plant species. The boundary of the riparian swamp portion of this wetland consists of a more gradual shift in elevation and dominant plant species. Wetland boundary in this area was determined by a shift in dominance of sphagnum moss in the wetland to feather moss in the upland.

4.1.9 Wetland 9 (WL9)

WL9 (Figure 11) is an open bog wetland approximately 4.6 ha in total area located along the western property boundary of the Project area (Figure 2). One paired sampling site was recorded (labeled as WL10 on data sheets in Appendix A). The wetland was determined to contain normal site conditions. The upland habitat surrounding this wetland consists of a mix of barren vegetation and coniferous forest.

The dominant vegetation at Data Point "WL9-WP1" in the subcanopy is Black Spruce and Huckleberry while Common Juniper, Bog Laurel (*Kalmia polifolia*), Pitcher Plant (*Sarracenia purpurea*) and Deer Grass (*Trichophorum caespitosus*) dominates the understory (Photo 29; Appendix C). The PI was observed to be 2.5. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated organic matter (Photo 30; Appendix C). Surface water was not found to be present however a strong water stained leaves (B9), sparsely vegetated concave surface (B8) and thin muck surface were all noted (C7).

The dominant species at Data Point "WL9-UP1" in the canopy is Black Spruce. Dominate species in the subcanopy include Black Spruce and Huckleberry while Lambkill and Star Flower dominate the understory (Photo 31; Appendix C). The PI was observed to be 2.7. The substrate was found to consist of a 20 cm duff layer over rock (Photo 32, Appendix C). The soil appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

4.1.10 Wetland 10 (WL10)

WL10 (Figure 12) is a small riparian treed swamp located along an unnamed stream at the western side of the Project Area. The upland habitat surrounding this wetland consists primarily of coniferous forest. One paired sampling site was recorded (labeled as WL11 on data sheets in Appendix A). The wetland was determined to contain normal site conditions.

The dominant vegetation at Data Point "WL10-WP1" in the canopy is Balsam Fir. Cinnamon Fern is the dominant species in the subcanopy while Three-seeded Sedge dominates the understory (Photo 33; Appendix C). The PI was observed to be 2.4. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated organic matter (Photo 34; Appendix C). Surface water was found to be present (A1) and soil saturation was at 5 cm (A3).

The dominant species at Data Point "WL10-UP1" in the canopy is Black Spruce and Balsam Fir. Dominant species in the subcanopy include Balsam Fir and Mountain Ash while Wild

Sarsaparilla and Star Flower dominate the understory (Photo 35; Appendix C). The PI was observed to be 2.9. The substrate was found to consist of a 10 cm duff layer over rock (Photo 36, Appendix C). The soil appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

4.1.11 Wetland 11 (WL11)

WL11 (Figure 13) is a large open bog located in the center of the Project Area on the east side of Fogherty Lake. The wetland is bordered on three sides by a shrub barren while Fogherty Lake borders the western boundary. One paired sampling site was recorded (labeled as WL12 on data sheets in Appendix A). The wetland was determined to contain normal site conditions.

The dominant vegetation at Data Point “WL11-WP1” is Larch in the canopy; Rhodora (*Rhododendron canadensis*), Mountain Holly and Huckleberry in the subcanopy; and Labrador Tea, Pitcher Plant and Three-leaved False Solomon’s Seal in the understory (Photo 37; Appendix C). The PI was observed to be 2.6. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated organic matter (Photo 38; Appendix C). Although surface water was not detected in the plot, soil saturation was at surface 5 cm (A3).

Larch, Red Maple and Black Spruce are the dominant species in the canopy at Data Point “WL11-UP1”. Huckleberry dominates the subcanopy while Bunchberry and Black Crowberry (*Empetrum nigrum*) dominated the understory (Photo 39; Appendix C). The PI was observed to be 3.0. The substrate was found to consist of a 11 cm duff layer over rock (Photo 40, Appendix C). The area appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the south, and north sides of WL11 were determined by an abrupt change in elevation. The boundary along the eastern and western ends of this wetland consists of a more gradual change in elevation however a distinct change in dominant vegetation and soil characteristics determined the boundary.

4.1.12 Wetland 12 (WL12)

WL12 (Figure 14) is an open bog/fen wetland approximately 0.3 ha in total area located in the central portion of the Project Area (Figure 2). One paired sampling site was recorded (labeled as WL13 on data sheets in Appendix A). The wetland was determined to contain normal site conditions although a skidder trail was noted to pass through the wetland. Upland habitat surrounding this wetland is primarily shrub barren with patches of coniferous forest.

The dominant vegetation at Data Point “WL12-WP1” cinnamon Fern in the subcanopy and Three-seeded Sedge in the understory (Photo 41; Appendix C). The PI was observed to be 2.7. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated

organic matter (Photo 42; Appendix C). Surface water was not found to be present in the plot however the water table was at 10cm (A2), while soil saturation was at surface (A3).

The dominant species at Data Point "WL12-UP1" is Huckleberry in the subcanopy (Photo 43; Appendix C). The PI was observed to be 2.7. The substrate was found to consist of a 5 cm duff layer over rock (Photo 44, Appendix C). The area appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the south, and north sides of WL12 were determined by an abrupt change in elevation. The boundary along the eastern and western ends of this wetland consisted of a more gradual change in elevation however a distinct change in dominant vegetation and soil characteristics determined the boundary.

4.1.13 Wetland 13 (WL13)

WL13 (Figure 15) is a treed swamp wetland approximately 0.6 ha in total area located in a depression in the landscape in the central portion of the Project Area (Figure 2). One paired sampling site was recorded (labeled as WL14 on data sheets in Appendix A). The wetland was determined to contain normal site conditions. Upland habitat surrounding this wetland consists primarily of shrub barren with patches of coniferous forest.

The dominant vegetation at Data Point "WL13-WP1" is Black Spruce and Red maple in the canopy and Mountain Holy, Wild Raisin and Cinnamon Fern in the subcanopy. Three-seeded Sedge and Wild Lily-of-the-valley dominate the understory (Photo 45; Appendix C). The PI was observed to be 1.9. The soil was determined to be a histic epipedon (A2) as there was 20 cm of accumulated organic matter over a silt layer with a colour of 5YR 2.5/1 (Photo 46; Appendix C). Soil saturation was at surface (A3) and a strong Hydrogen Sulfide odor was detected (C1).

Black Spruce was the dominant species at Data Point "WL13-UP1" in the canopy while Green Alder, Huckleberry, Mountain Holy and Black Spruce dominate the subcanopy. Bunch Berry and Black Crowberry dominate the understory (Photo 47; Appendix C). The PI was observed to be 2.8. The substrate was found to consist of a 5 cm duff layer over rock (Photo 48, Appendix C). The area appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along all sides of WL13 were determined by an abrupt change in elevation.

4.1.14 Wetland 14 (WL14)

WL14 (Figure 16) is a fen/bog wetland complex approximately 6.2 ha in total area located along an unnamed stream in the eastern side of the Project Area (Figure 2). One paired sampling

site was recorded (labeled as WL15 on data sheets in Appendix A). The wetland was determined to contain normal site conditions. Upland habitat surrounding this wetland consists primarily of coniferous forest intermixed with shrub barren.

The dominant vegetation at Data Point "WL14-WP1" is Black Spruce and Balsam Fir in the canopy and Sweet Gale and Huckleberry in the subcanopy. Three-leaved False Solomon's Seal dominates the understorey (Photo 49; Appendix C). The PI was observed to be 2.6. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated organic matter (Photo 50; Appendix C). Surface water was present (A1), the water table was at 5 cm (A2) and soil saturation was at surface (A3).

Black Spruce was the dominant species at Data Point "WL14-UP1" in the canopy while Black Spruce, Huckleberry and Lambkill dominate the subcanopy. Lambkill and Black Crowberry dominate the understory (Photo 51; Appendix C). The PI was observed to be 2.8. The substrate was found to consist of an 8 cm duff layer over rock (Photo 52, Appendix C). The area appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the south, and north sides of WL14 were determined by an abrupt change in elevation. The boundary along the eastern and western ends of this wetland consisted of a more gradual change in elevation however a distinct change in dominant vegetation and soil characteristics determined the boundary.

4.1.15 Wetland 15 (WL15)

WL15 (Figure 17) is a riparian fen wetland approximately 0.07 ha in total area located along an unnamed stream in the center of the Project Area (Figure 2). One paired sampling site was recorded (labeled as WL16 on data sheets in Appendix A). The wetland was determined to contain normal site conditions. Upland habitat surrounding this wetland consists primarily of coniferous forest intermixed with shrub barren.

The dominant species at Data Point "WL15-WP1" is Black Spruce in the canopy and Sweet Gale, Cinnamon Fern and Mountain Holy in the subcanopy. Three-seeded sedge dominates the understorey (Photo 53; Appendix C). The PI was observed to be 2.7. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated organic matter (Photo 54; Appendix C). Surface water was not present however the water table was at 10 cm (A2) and soil saturation was at surface (A3).

Black Spruce and Balsam Fir were the dominant species at Data Point "WL15-UP1" in the canopy while Lambkill is dominant in the subcanopy. Late Low-bush Blueberry (*Vaccinium angustifolium*), Bunchberry and Blackberry (*Rubus allegheniensis*) dominate the understory (Photo 55; Appendix C). The PI was observed to be 3.0. The substrate was found to consist of a 10 cm duff layer over rock (Photo 56, Appendix C). The area appeared to be well drained with

no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along all sides of WL15 were determined by an abrupt change in elevation.

4.1.16 Wetland 16 (WL16)

WL16 (Figure 18) is a bog wetland approximately 0.45 ha in total area located along an unnamed stream in the center of the Project Area (Figure 2). This wetland was originally identified as two separate wetlands (WL19 and WL20 on data sheets on Appendix A) however further field investigations identified that these areas are in fact connected to form one contiguous wetland. One paired sampling site was recorded. The wetland was determined to contain normal site conditions. Upland habitat surrounding this wetland consists primarily of coniferous forest.

The dominant species at Data Point "WL16-WP1" is Black Spruce and Larch in the canopy and Lambkill and Balsam Fir in the subcanopy. Three-seeded sedge and Three-leaved False Solomon's Seal dominates the understorey (Photo 57; Appendix C). The PI was observed to be 2.6. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated organic matter (Photo 58; Appendix C). Surface water was not present however soil saturation was at 5 cm (A3) and a strong Hydrogen Sulfide odor was detected.

Black Spruce, Red Maple and Balsam Fir were the dominant species at Data Point "WL16-UP1" in the canopy while Balsam Fir is dominant in the subcanopy. Wild Lily-of-the-valley is dominant in the understory (Photo 59; Appendix C). The PI was observed to be 2.9. The substrate was found to consist of a 16 cm duff layer over a 3 cm sand Ae horizon with a colour of 10YR 5/2, over rock (Photo 60, Appendix C). The area appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the north and south sides of WL16 were determined by an abrupt change in elevation. The boundary along the eastern and western ends of this wetland consisted of a more gradual change in elevation however a distinct change in dominant vegetation and soil characteristics determined the boundary.

4.1.17 Wetland 17 (WL17)

WL17 (Figure 19) is a bog/Swamp wetland complex approximately 0.74 ha in total area located along the proposed access road to the Site (Figure 2). One paired sampling site was recorded (labeled as WL21 on the data sheets in Appendix A). The wetland was determined to contain normal site conditions. Upland habitat surrounding this wetland consists primarily of coniferous forest.

The dominant species at Data Point "WL17-WP1" is Black Spruce in the canopy. Leatherleaf, Rhodora, Balsam Fir and Black Spruce dominate the subcanopy. White-beaked Rush and

Three-leaved False Solomon's Seal dominate the understorey (Photo 61; Appendix C). The PI was observed to be 1.6. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated organic matter (Photo 62; Appendix C). Surface water was not present however soil saturation was at surface (A3) and the water table was at 10cm (A2).

Black Spruce and Balsam Fir were the dominant species at Data Point "WL17-UP1" in the canopy and subcanopy. Lambkill is dominant in the understory (Photo 63; Appendix C). The PI was observed to be 2.6. The substrate was found to consist of a 10 cm duff layer over a 6 cm silt loam Ae horizon with a colour of 10YR 6/2, otop a 5 cm clay loam B horizon with a colour of 7.5YR 5/4, over rock (Photo 64, Appendix C). The area appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the north and south sides of WL17 were determined by an abrupt change in elevation. The boundary along the eastern and western ends of this wetland consisted of a more gradual change in elevation however a distinct change in dominant vegetation and soil characteristics determined the boundary.

4.1.18 Wetland 18 (WL18)

WL18 (Figure 20) is a bog wetland approximately 0.07 ha in total area located along the proposed access road to the Site (Figure 2). One paired sampling site was recorded (labeled as WL22 on the data sheets in Appendix A). The wetland was determined to contain normal site conditions. Upland habitat surrounding this wetland consists primarily of coniferous forest.

The dominant species at Data Point "WL18-WP1" is Black Spruce in the canopy and subcanopy. Three-leaved False Solomon's Seal, Bunchberry, Three-seeded Sedge and Cinnamon Fern dominate the understorey (Photo 65; Appendix C). The PI was calculated to be 2.3. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated organic matter (Photo 66; Appendix C). Surface water was not present however soil saturation was at surface (A3) and the water table was at 10cm (A2).

Black Spruce was the dominant species at Data Point "WL18-UP1" in the canopy while Lambkill and Huckleberry dominate the subcanopy. Bunchberry is dominant in the understory (Photo 67; Appendix C). The PI was observed to be 2.9. The substrate was found to consist of a 10 cm duff layer over a 5 cm silt loam Ae horizon with a colour of 10YR 5/2, over rock (Photo 68, Appendix C). The area appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the north, east and south sides of WL18 were determined by an abrupt change in elevation. The boundary along the western ends of this wetland consisted of a more gradual change in elevation however a distinct change in dominant vegetation and soil characteristics determined the boundary.

4.1.19 Wetland 19 (WL19)

WL19 (Figure 21) is a bog wetland approximately 0.04 ha in total area located along the proposed access road to the Site (Figure 2). One paired sampling site was recorded (labeled as WL23 on the data sheets in Appendix A). The wetland was determined to contain normal site conditions. Upland habitat surrounding this wetland consists primarily of coniferous forest.

The dominant species at Data Point "WL19-WP1" is Larch in the canopy. The dominant species in the subcanopy include Huckleberry, Mountain Holy and Baltic Rush (*Juncus arcticus*). Deer Grass, White-beaked Rush and Pitcher Plant dominate the understorey (Photo 69; Appendix C). The PI was calculated to be 1.3. The soil was determined to be a histosol (A1) as there was more than 40 cm of accumulated organic matter (Photo 70; Appendix C). Surface water was not present however soil saturation was at surface (A3) and the water table was at 10cm (A2).

Huckleberry was the dominant species at Data Point "WL19-UP1" in the subcanopy while Lambkill and Black Crowberry is dominant in the understory (Photo 71; Appendix C). The PI was observed to be 3.0. The substrate was found to consist of a 5 cm duff layer over rock (Photo 72, Appendix C). The area appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the north, east and south sides of WL19 were determined by an abrupt change in elevation. The boundary along the western ends of this wetland consisted of a more gradual change in elevation however a distinct change in dominant vegetation and soil characteristics determined the boundary.

4.1.20 Wetland 20 (WL20)

WL20 (Figure 22) is a bog wetland approximately 0.15 ha in total area located along the proposed access road to the Site (Figure 2). One paired sampling site was recorded (labeled as WL24 on the data sheets in Appendix A). The wetland was determined to contain normal site conditions. Upland habitat surrounding this wetland consists primarily of coniferous forest.

The dominant species at Data Point "WL20-WP1" is Larch in the canopy. The dominant species in the subcanopy include Huckleberry, Mountain Holy, Sweet Gale and Wild Raisin. Deer Grass and Pitcher Plant dominate the understorey (Photo 73; Appendix C). The PI was calculated to be 2.0. The soil was determined to be a Black Histic (A3) as there was 20 cm of accumulated organic matter accumulated over a 10 cm loam sand horizon with a colour of 10YR 5/2 (Photo 74; Appendix C). Surface water was not present however soil saturation was at surface (A3).

Larch and Black Spruce were the dominant species at Data Point "WL20-UP1" in the canopy. Huckleberry, Wild Raisin and Rhodora were dominants in the subcanopy while Late Low-bush Blueberry is dominant in the understory (Photo 75; Appendix C). The PI was observed to be 3.0. The substrate was found to consist of a 10 cm duff layer over rock (Photo 76, Appendix C).

The area appeared to be well drained with no presence of saturation. Although the sample point has hydrophytic vegetation, the lack of hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the north and south sides of WL20 were determined by an abrupt change in elevation. The boundary along the western ends of this wetland consisted of a more gradual change in elevation however a distinct change in dominant vegetation and soil characteristics determined the boundary.

4.1.21 Wetland 21 (WL21)

WL21 (Figure 23) is a Fen wetland approximately 0.19 ha in total area located close the coast at the northeast end of the Project Area (Figure 2). One paired sampling site was recorded (labeled as WL25 on the data sheets in Appendix A). The wetland was determined to contain normal site conditions. Upland habitat surrounding this wetland consists primarily of coniferous forest to the south and cobble/gravel/sand beach to the north.

Balsam Fir, White Spruce and Red Maple are the dominant species at Data Point "WL21-WP1" in the canopy. The dominant species in the subcanopy include Black Choke Berry and Lambkill. Bunchberry, Tawny Cotton-grass (*Eriophorum virginicum*), Bog Aster, and Soft Rush (*Juncus effuses*) dominate the understorey (Photo 77; Appendix C). The PI was calculated to be 2.5. The soil was determined to be a Histosol (A1) as there was 30 cm of accumulated organic matter accumulated over bedrock (Photo 78; Appendix C). Surface water was not present however soil saturation was at 5 cm (A3).

Balsam Fir and White Spruce were the dominant species at Data Point "WL21-UP1" in the canopy. Balsam Fir, Mountain Ash, Green Alder, and White Birch were dominants in the subcanopy while Bunchberry, Mountain Woodfern, Blackberry, and Mountain Cranberry are dominant in the understory (Photo 79; Appendix C). The PI was observed to be 3.1. The substrate was found to consist of a 10 cm duff layer over a 20 cm sand loam B horizon (10YR 3/6), over rock (Photo 80, Appendix C). The area appeared to be well drained with no presence of saturation. The lack of hydrophytic vegetation, hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along the west, east and south sides of WL21 were determined by an abrupt change in elevation. The boundary along the northern side of this wetland was determined by the presence of the beach.

4.1.22 Wetland 22 (WL22)

WL22 (Figure 24) is a Fen wetland approximately 0.1 ha in total area located along an unnamed stream in the northeast end of the Project Area (Figure 2). One paired sampling site was recorded (labeled as WL26 on the data sheets in Appendix A). The wetland was determined to contain normal site conditions. Upland habitat surrounding this wetland consists primarily of coniferous forest.

Balsam Fir and White Spruce are the dominant species at Data Point “WL22-WP1” in the canopy. The dominant species in the subcanopy include Black Choke Berry, Green Alder and Leatherleaf. Bog Aster, Canada Bluejoint (*Calamagrostis canadensis*) and Swamp Loosestrife (*Lysmachia terrestris*) dominate the understorey (Photo 81; Appendix C). The PI was calculated to be 1.4. The soil was determined to be a Histosol (A1) as there was over 40 cm of accumulated organic matter accumulated (Photo 82; Appendix C). Surface water was not present however soil saturation was at 3 cm (A3) and Hydrogen Sulfide odor was detected (C1).

White Spruce was the dominant species at Data Point “WL22-UP1” in the canopy. Balsam Fir, Mountain Ash and White Birch were determined to be dominants in the subcanopy while Bunchberry and Mountain Woodfern are dominant in the understory (Photo 83; Appendix C). The PI was observed to be 3.1. The substrate was found to consist of a 15 cm duff layer over a 10 cm silt loam B horizon (7.5YR 3/3) (Photo 84, Appendix C). The area appeared to be well drained with no presence of saturation. The lack of hydophytic vegetation, hydric soil and wetland hydrology identifies this site as upland.

Wetland boundaries along all sides of WL22 were determined by an abrupt change in elevation.

4.2 Functional Assessments

The resulting description of wetland functions will provide the baseline for further assessment and monitoring of project impacts. The description of wetland functions is intended to be conservative. Completed assessment forms are located in Appendix D.

4.2.1 Ecological Characterization

The Project occurs within the tertiary watershed (1EQ-SD) within which covers approximately 518 km² and encompasses the land east of the Project site to the eastern end of Guysborough County and extends west of the Project site to the community of Goldboro. Land cover within the majority of this watershed is forested and open natural areas (e.g. barrens) with a combined coverage of approximately 86% of tertiary watershed 1EQ-SD. Wetlands also constitute a relatively moderate component of this wetland covering approximately 11% of the total area. Anthropogenic development in this area is relatively low with residential, gravel pits, roads and landfills combining for a total coverage of approximately 7% of the tertiary land cover.

Forestry is the greatest stress within the tertiary watershed where large clear cut and partial cut blocks are noted to occur throughout the area. The overall watershed condition is relatively unaltered with a low percentage of impervious surfaces. The reliance on individual wetlands to contribute to flood water detention is moderate given the proportion of total wetland area in this watershed.

Land cover in the Project area consists primarily of coniferous / mixed forest in various successional stages intermixed with open shrub dominated areas and wetlands. A number of small streams are located within the Project area, the largest occurring in the southwestern end

which flows south through WL1 before connecting to Indian Cove Creek. Fish surveys conducted within the small streams in the Project Area as well as Fogherty Lake (also occurring on the Project Area) found no fish species present which may be attributed to the very low pH of the surface water present onsite.

Vegetation surveys conducted during previous years and supplemented during the 2014 field surveys indicated that no plant species at risk listed under the federal Species at Risk Act (SARA) or Nova Scotia Endangered Species Act (NSESA) were recorded in the Project area. One plant species of conservation concern, Northern Comandra (*Geocaulon lividum* – ACCDC rank; S3) was recorded in wetland 22 (WL22). Southern Twayblade (*Listera australis* – ACCDC rank; S2) was also found along two watercourses in the west side of the Project Area. three lichen species of conservation concern were also noted in many of the wetlands within the Project Area including; Black-footed Reindeer Lichen (*Cladonia stygia* – Canada General Status rank; 3: ACCDC rank; S2S3), Naked Kidney Lichen (*Nephroma bellum* – Canada General Status rank; 3: ACCDC rank; S3?) and Coastal Bushy Beard Lichen (*Usnea flammea* – Canada General Status rank; 3: ACCDC rank; S2S3).

Surface hydrology in the area flows in two major directions on the property. The western and northern portion of the site drains in a northerly direction towards the ocean, while the central and southeastern section of the site flows in a southeast direction into Indian Cove Creek. A small portion of the eastern edge of the Project Area also flows in an easterly direction towards Murphy's Lake and eventually to the ocean.

Groundwater flow is inferred to follow similar directional flow as surface drainage patterns. Based on various characteristics such as wetland soils, land use in the subwatershed upstream, topographic relief surrounding wetlands and hydroperiod of wetland, 16 of the 22 wetlands assessed are likely groundwater discharge sites. Wetlands 9, 11, 16, 19 and 20 were found to potentially serve as groundwater recharge sites. Wetland 9 and 10 are relatively large in size however the groundwater flow path originating from these wetlands flows toward the ocean with no downstream users identified. A total of 16 wells are recorded in the NS well log database, however given the relative small size of wetlands 16, 19 and 20, the location of wetlands 9 and 11 relative to potable water wells and since the remaining wetlands in the Project area are likely discharge wetlands, it is unlikely that the Project impacts on wetlands will have any significant impact on the ground water flow regime and potable water wells of the area.

4.2.2 Significant Wetland Functions

The functional assessments conducted for the 22 wetlands located within the Project site determined that the overall watershed condition within which these wetlands are located is in a relatively unaltered state with wetland habitat covering approximately 11% of the total land area of the watershed. The buffer area surrounding these wetlands is fully vegetated and relatively unaltered providing high quality wildlife habitat and water quality functions. All wetlands assessed were determined to provide high floristic quality where the plant community is composed of native species characteristic of the wetland type with a very minor component of non-native species. Table 4.3 presents and summary of the various significant functions each

wetland was assessed to provide (see Appendix D for more details regarding the functional assessments).

Table 4.3: Wetland Functional Assessment Summary

Significant Function	WL1	WL2	WL3	WL4	WL5	WL6	WL7	WL8	WL9	WL10	WL11	WL12	WL13	WL14	WL15	WL16	WL17	WL18	WL19	WL20	WL21	WL22

Notes:																						
* SF7/SF25/SF27 is considered a red rated function if a species present is listed by SARA or NSESA as Endangered/Threatened/Special Concern; NSDNR - Red listed; or Ranked by ACCDC as S1																						
Cells highlighted in red indicate this function is considered to be critical to the watershed or represent a highly degraded watershed. These functions are typically unique or rare or associated with a high risk to the watershed if lost (NSE 2014).																						
Unless otherwise stated: H=High; M=Moderate/Medium; L=Low; Y=Yes; N=No; NAT=Natural																						

4.2.2.1 Wetland 1 (WL1)

WL1 is characterized as a wetland complex comprised of a mix of bog and swamp types. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

This wetland is important in maintaining stream flow of the unnamed stream that flows along the east side of the Project area (SF14). The hydrologic condition of this wetland is considered natural with a moderate ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with high species diversity and little to no influence of invasive/non-native species. This complex consists of a number of different wetland types and as such it is considered to have a high diversity of high quality vegetation communities (SF23 and SF24). One lichen species of conservation concern, Black-footed Reindeer Lichen (*Cladonia stygia* – ACCDC rank; S2S3) was recorded in WL1.

The wetland may provide moderate habitat to amphibians, reptiles and mammals. This wetland may provide open aesthetic functions as well as berry picking and plant gathering opportunities as it is somewhat accessible to the public via the power line transmission corridor (SF29).

Red rated significant functions provided by this wetland includes maintaining stream flow in a first/second order stream.

4.2.2.2 Wetland 2 (WL2)

WL2 is characterized as a wetland complex comprised of marsh, fen and swamp wetland types. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function. This wetland borders a small pond at the northern boundary located behind a barrier beach. This area does receive periodic salt water influx during storm events, however the vegetation present in this wetland indicate that this is a fresh water pond.

The hydrologic condition of this wetland is considered natural with a high ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17). Given the location of this wetland within the landscape, it provides a high ability to stabilize the shoreline (SF21) in particular during storm events.

The plant community in this wetland was determined to be relatively intact with high species diversity and little to no influence of invasive/non-native species. This complex consists of a number of different wetland types and as such it is considered to have a high diversity of high quality vegetation communities (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals (SF28). This wetland may provide open aesthetic functions however since this wetland is not readily accessible by the public, community use functions are assessed as low (SF29).

Red rated significant functions provided by this wetland include stabilizing the shoreline (SF21).

4.2.2.3 Wetland 3 (WL3)

WL3 is characterized as a sloped throughflow fen wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

This wetland is important in maintaining stream flow of the unnamed stream that flows through this wetland (SF14). The hydrologic condition of this wetland is considered natural with a moderate ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. Although this wetland contains low diversity of plant communities, the community present is of high quality (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals (SF28). This wetland may provide open aesthetic functions however since this wetland is not readily accessible by the public, community use functions are assessed as low (SF29).

Red rated significant functions provided by this wetland includes maintaining stream flow in a first/second order stream.

4.2.2.4 Wetland 4 (WL4)

WL4 is characterized as an isolated treed bog wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural (SF13) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with low species diversity but little to no influence of invasive/non-native species. This wetland is considered to have a low diversity of plant communities, however the vegetation community present is considered of high quality (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals. This wetland is not readily available to the public and as such provides low community use value (SF29).

No red rated significant functions were assessed for this wetland.

4.2.2.5 Wetland 5 (WL5)

WL5 is characterized as a sloped throughflow fen wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural with a moderate ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. Although this wetland contains low diversity of plant communities, the community present is of high quality (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals (SF28). This wetland may provide open aesthetic functions however since this wetland is not readily accessible by the public, community use functions are assessed as low (SF29).

No red rated functions were assessed for this wetland.

4.2.2.6 Wetland 6 (WL6)

WL6 is characterized as an outflow bog wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

This wetland is important in maintaining stream flow of the unnamed stream that originates from the west and east ends of this wetland (SF14). The hydrologic condition of this wetland is

considered natural with a moderate ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. Although this wetland contains low diversity of plant communities, the community present is of high quality (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals (SF28). This wetland is not readily available to the public and as such provides low community use value (SF29).

Red rated significant functions provided by this wetland includes maintaining stream flow in a first/second order stream.

4.2.2.7 Wetland 7 (WL7)

WL7 is characterized as a throughflow swamp wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural with a moderate ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with low species diversity and little to no influence of invasive/non-native species. Although this wetland contains low diversity of plant communities, the community present is of high quality (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals (SF28). This wetland is not readily available to the public and as such provides low community use value (SF29).

No red rated significant functions were assessed for this wetland.

4.2.2.8 Wetland 8 (WL8)

WL8 is characterized as a wetland complex comprised of a mix of bog, fen and swamp types. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

This wetland is important in maintaining stream flow of the unnamed stream that flows along the east side of the Project area (SF14). The hydrologic condition of this wetland is considered natural with a moderate ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with high species diversity and little to no influence of invasive/non-native species. This complex consists of a number of different wetland types and as such it is considered to have a high diversity of high quality vegetation communities (SF23 and SF24). Two lichen species of conservation concern, Black-footed Reindeer Lichen (*Cladonia stygia* – ACCDC rank; S2S3) and Coastal Bushy Heard Lichen (*Usnea flammea* – ACCDC rank; S2S3) were recorded in WL8.

The wetland may provide moderate habitat to amphibians, reptiles and mammals. This wetland may provide open aesthetic functions as well as berry picking and plant gathering opportunities however since this wetland is not readily accessible by the public, community use functions are assessed as low (SF29).

Red rated significant functions provided by this wetland includes maintaining stream flow in a first/second order stream (SF14). The Bog Portion of this wetland may also serve as a groundwater recharge site (SF19).

4.2.2.9 Wetland 9 (WL9)

WL9 is characterized as an isolated domed bog wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural (SF13) with little evidence of excess nutrient loading or contamination (SF17). Where this wetland is a large isolated bog with no visible inlet or outlet it may serve as a groundwater recharge site (SF19).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. This wetland is considered to have a moderate diversity of high quality plant communities (SF23 and SF24). One lichen species of conservation concern, Black-footed Reindeer Lichen (*Cladonia stygia* – ACCDC rank; S2S3) was recorded in WL9.

The wetland may provide moderate habitat to amphibians, reptiles and mammals. This wetland may provide open aesthetic functions as well as berry picking and plant gathering opportunities however since this wetland is not readily accessible by the public, community use functions are assessed as low (SF29).

Red rated significant functions provided by this wetland includes potentially serving as a groundwater recharge site (SF19).

4.2.2.10 Wetland 10 (WL10)

WL10 is characterized as a throughflow treed swamp wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural with a moderate ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with low species diversity and little to no influence of invasive/non-native species. Although this wetland contains low diversity of plant communities, the community present is of high quality (SF23 and SF24). One lichen species of conservation concern, Naked Kidney Lichen (*Nephroma bellum* – ACCDC rank; S3?) was recorded in WL10.

The wetland may provide moderate habitat to amphibians, reptiles and mammals (SF28). This wetland is not readily available to the public and as such provides low community use value (SF29).

No red rated significant functions were assessed for this wetland.

4.2.2.11 Wetland 11 (WL11)

WL11 is characterized as an isolated domed bog wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural (SF13) with little evidence of excess nutrient loading or contamination (SF17). Since this wetland is a large isolated bog with no visible inlet or outlet it may serve as a groundwater recharge site (SF19).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. This wetland is considered to have a moderate diversity of high quality plant communities (SF23 and SF24). One lichen species of conservation concern, Black-footed Reindeer Lichen (*Cladonia stygia* – ACCDC rank; S2S3) was recorded in WL11.

The wetland may provide moderate habitat to amphibians, reptiles and mammals. This wetland may provide open aesthetic functions as well as berry picking and plant gathering opportunities however since this wetland is not readily accessible by the public, community use functions are assessed as low (SF29).

Red rated significant functions provided by this wetland includes potentially serving as a groundwater recharge site (SF19).

4.2.2.12 Wetland 12 (WL12)

WL12 is characterized as an outflow bog / fen wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural with a moderate ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. Although this wetland contains low diversity of plant communities, the community present is of high quality (SF23 and SF24). One lichen species of conservation concern, Coastal Bushy Beard Lichen (*Usnea flammea* – ACCDC rank; S2S3) was recorded in WL12.

The wetland may provide moderate habitat to amphibians, reptiles and mammals (SF28). This wetland is not readily available to the public and as such provides low community use value (SF29).

No red rated significant functions were assessed for this wetland.

4.2.2.13 Wetland 13 (WL13)

WL13 is characterized as an isolated treed swamp wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural (SF13) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with low species diversity but little to no influence of invasive/non-native species. This wetland is considered to have a low diversity of plant communities, however the vegetation community present is considered of high quality (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals. This wetland is not readily available to the public and as such provides low community use value (SF29).

No red rated significant functions were assessed for this wetland.

4.2.2.14 Wetland 14 (WL14)

WL14 is characterized as a wetland complex comprised of a mix of bog and fen types. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

This wetland is important in maintaining stream flow of the unnamed stream that flows through the wetland to the southeast (SF14). The hydrologic condition of this wetland is considered natural with a high ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17). The wetland also provides a significant flood/stormwater attenuation function for the surrounding landscape.

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. This complex consists of a number of different wetland types and as such it is considered to have a moderate diversity of high quality vegetation communities (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals. This wetland is not readily available to the public and as such provides low community use value (SF29).

Red rated significant functions provided by this wetland includes maintaining stream flow in a first/second order stream.

4.2.2.15 Wetland 15 (WL15)

WL15 is characterized as a sloped throughflow fen wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural with a moderate ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. Although this wetland contains low diversity of plant communities, the community present is of high quality (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals (SF28). This wetland is not readily available to the public and as such provides low community use value (SF29).

No red rated significant functions were assessed for this wetland.

4.2.2.16 Wetland 16 (WL16)

WL16 is characterized as an isolated bog wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural (SF13) with little evidence of excess nutrient loading or contamination (SF17). Since this wetland is an isolated bog with no visible inlet or outlet it may serve as a groundwater recharge site (SF19).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. This wetland is considered to have a low diversity of plant communities, however the vegetation community present is considered to be of high quality (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals. This wetland is not readily available to the public and as such provides low community use value (SF29).

Red rated significant functions provided by this wetland includes potentially serving as a groundwater recharge site (SF19).

4.2.2.17 Wetland 17 (WL17)

WL17 is characterized as an outflow bog / swamp wetland complex. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

This wetland is important in maintaining stream flow of the unnamed stream that flows of the wetland at the southwest end (SF14). The hydrologic condition of this wetland is considered natural with a high ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. This wetland contains a moderate diversity of high quality plant communities (SF23 and SF24). Two lichen species of conservation concern, Coastal Bushy Beard Lichen (*Usnea flammea* – ACCDC rank; S2S3) and Naked Kidney Lichen (*Nephroma bellum* – ACCDC rank S3?) was recorded in WL17.

The wetland may provide moderate habitat to amphibians, reptiles and mammals (SF28). This wetland is not readily available to the public and as such provides low community use value (SF29).

Red rated significant functions provided by this wetland includes maintaining stream flow in a first/second order stream.

4.2.2.18 Wetland 18 (WL18)

WL18 is characterized as an isolated bog wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural (SF13) with little evidence of excess nutrient loading or contamination (SF17). Since this wetland is an isolated bog with no visible inlet or outlet it may serve as a groundwater recharge site (SF19).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. This wetland contains a moderate diversity of high quality plant communities (SF23 and SF24). One plant species of conservation concern, Northern Comandra (*Geocaulon lividum* – ACCDC rank; S3) was recorded in WL18. One lichen species of conservation concern, Black-footed Reindeer Lichen (*Cladonia stygia* – ACCDC rank; S2S3) was also recorded in WL18.

The wetland may provide moderate habitat to amphibians, reptiles and mammals. This wetland is not readily available to the public and as such provides low community use value (SF29).

Red rated significant functions provided by this wetland includes potentially serving as a groundwater recharge site (SF19).

4.2.2.19 Wetland 19 (WL19)

WL19 is characterized as an isolated bog wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural (SF13) with little evidence of excess nutrient loading or contamination (SF17). Since this wetland is an isolated bog with no visible inlet or outlet it may serve as a groundwater recharge site (SF19).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. This wetland contains a moderate diversity of high quality plant communities (SF23 and SF24). One lichen species of conservation concern, Black-footed Reindeer Lichen (*Cladonia stygia* – ACCDC rank; S2S3) was recorded in WL19.

The wetland may provide moderate habitat to amphibians, reptiles and mammals. This wetland is not readily available to the public and as such provides low community use value (SF29).

Red rated significant functions provided by this wetland includes potentially serving as a groundwater recharge site (SF19).

4.2.2.20 Wetland 20 (WL20)

WL20 is characterized as an isolated bog wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural (SF13) with little evidence of excess nutrient loading or contamination (SF17). Since this wetland is an isolated bog with no visible inlet or outlet it may serve as a groundwater recharge site (SF19).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. This wetland contains a moderate diversity of high quality plant communities (SF23 and SF24). One lichen species of conservation concern, Black-footed Reindeer Lichen (*Cladonia stygia* – ACCDC rank; S2S3) was recorded in WL20.

The wetland may provide moderate habitat to amphibians, reptiles and mammals. This wetland is not readily available to the public and as such provides low community use value (SF29).

Red rated significant functions provided by this wetland includes potentially serving as a groundwater recharge site (SF19).

4.2.2.21 Wetland 21 (WL21)

WL21 is characterized as a sloped inflow fen wetland. Although there is no outflow channel present, outflow from this wetland likely occurs under/through the boulder cobble beach located along the northern boundary of this wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural with a moderate ability to detain surface water (SF15). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. Although this wetland contains low diversity of plant communities, the community present is of high quality (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals (SF28). This wetland is not readily available to the public and as such provides low community use value (SF29).

No red rated significant functions were assessed for this wetland.

4.2.2.22 Wetland 22 (WL22)

WL22 is characterized as a sloped throughflow fen wetland. The integrity of this wetland and surrounding buffer is considered to be high where impacts to this wetland are minimal and the adjacent buffer area is considered to be in a natural state and fully vegetated (SF3 and SF4). The buffer zone surrounding the wetland provides high quality wildlife habitat and water quality function.

The hydrologic condition of this wetland is considered natural with a moderate ability to detain surface water (SF15) and stabilize the shoreline (SF21). The wetland was also determined to improve water quality (SF16) with little evidence of excess nutrient loading or contamination (SF17).

The plant community in this wetland was determined to be relatively intact with moderate species diversity and little to no influence of invasive/non-native species. Although this wetland contains low diversity of plant communities, the community present is of high quality (SF23 and SF24).

The wetland may provide moderate habitat to amphibians, reptiles and mammals (SF28). This wetland is not readily available to the public and as such provides low community use value (SF29).

No red rated significant functions were assessed for this wetland.

5.0 CONCLUSION

A total of 22 wetlands were encountered within the Project study area. Habitat and functional assessments and field delineations were conducted for all wetlands encountered within the Project study area boundary.

The functional assessment indicate that 12 of the 22 wetlands perform red rated significant functions which elevate the relative importance of these wetlands in terms of the functions they provide to the surrounding watershed. Six of the wetlands assessed with red rated significant functions (WL1, 3, 6, 8, 14 and 17) occur along or form the headwater of small watercourses throughout the site and as such are important in maintaining stream flow. Seven of the wetlands assessed as having red rated significant functions (WL 8, 9, 11, 16, 18, 19 and 20) may serve as groundwater recharge sites while one wetland (WL2) provides a red rated significant function of stabilizing the shoreline. Results of this study will be used to assess the potential impacts of the proposed Black Point Quarry on wetland habitat within the Project Study Area.

Hydrophytic Vegetation Indicators:
 ___ Rapid Test for Hydrophytic Vegetation
☒ Dominance Test is >50%
☒ Prevalence Index is ≤3.0¹
 ___ Morphological Adaptations¹ (Provide supporting data in Remarks or on a separate sheet)
 ___ Problematic Hydrophytic Vegetation¹ (Explain)

¹Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes ☒ No ☐

Remarks: (Include photo numbers here or on a separate sheet.)

SOIL

Sampling Point: 4L17-4P1

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-20								
20-35 ⁺	10YR 3/2	100					Loamy Sand	

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains.²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators:

- ☐ Histosol (A1)
☐ Histic Epipedon (A2)
☒ Black Histic (A3)
☐ Hydrogen Sulfide (A4)
☐ Stratified Layers (A5)
☐ Depleted Below Dark Surface (A11)
☐ Thick Dark Surface (A12)
☐ Sandy Mucky Mineral (S1)
☐ Sandy Gleyed Matrix (S4)

- ☐ Sandy Redox (S5)
☐ Polyvalue Below Surface (S8)
☐ Thin Dark Surface (S9)
☐ Loamy Gleyed Matrix (F2)
☐ Depleted Matrix (F3)
☐ Redox Dark Surface (F6)
☐ Depleted Dark Surface (F7)
☐ Redox Depressions (F8)

Indicators for Problematic Hydric Soils³:

- ☐ Coast Prairie Redox (A16)
☐ 5 cm Mucky Peat or Peat (S3)
☐ Iron-Manganese Masses (F12)
☐ Piedmont Floodplain Soils (F19)
☐ Red Parent Material (TF2)
☐ Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if observed):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ☒ No ☐

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

- ☐ Surface Water (A1)
☐ High Water Table (A2)
☒ Saturation (A3)
☐ Water Marks (B1)
☐ Sediment Deposits (B2)
☐ Drift Deposits (B3)
☐ Algal Mat or Crust (B4)
☐ Iron Deposits (B5)
☐ Inundation Visible on Aerial Imagery (B7)
☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9)
☐ Aquatic Fauna (B13)
☐ Marl Deposits (B15)
☐ Hydrogen Sulfide Odor (C1)
☐ Oxidized Rhizospheres on Living Roots (C3)
☐ Presence of Reduced Iron (C4)
☐ Recent Iron Reduction in Tilled Soils (C6)
☐ Thin Muck Surface (C7)
☐ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- ☐ Surface Soil Cracks (B6)
☐ Drainage Patterns (B10)
☐ Moss Trim Lines (B16)
☐ Dry-Season Water Table (C2)
☐ Saturation Visible on Aerial Imagery (C9)
☐ Stunted or Stressed Plants (D1)
☐ Geomorphic Position (D2)
☐ Shallow Aquitard (D3)
☐ Microtopographic Relief (D4)
☐ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ☐ No ☒ Depth (inches): _____Water Table Present? Yes ☐ No ☒ Depth (inches): _____Saturation Present? Yes ☒ No ☐ Depth (inches): 3cmWetland Hydrology Present? Yes ☒ No ☐

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

SOIL

Sampling Point: W7-4P1

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-40"							organic	Peat

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains.

²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators:

- ☒ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Stratified Layers (A5)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)

- ☐ Sandy Redox (S5)
- ☐ Polyvalue Below Surface (S8)
- ☐ Thin Dark Surface (S9)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)

Indicators for Problematic Hydric Soils³:

- ☐ Coast Prairie Redox (A16)
- ☐ 5 cm Mucky Peat or Peat (S3)
- ☐ Iron-Manganese Masses (F12)
- ☐ Piedmont Floodplain Soils (F19)
- ☐ Red Parent Material (TF2)
- ☐ Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if observed):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ☒ No ☐

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

- ☐ Surface Water (A1)
- ☐ High Water Table (A2)
- ☐ Saturation (A3)
- ☐ Water Marks (B1)
- ☐ Sediment Deposits (B2)
- ☐ Drift Deposits (B3)
- ☐ Algal Mat or Crust (B4)
- ☐ Iron Deposits (B5)
- ☐ Inundation Visible on Aerial Imagery (B7)
- ☐ Sparsely Vegetated Concave Surface (B8)
- ☐ Water-Stained Leaves (B9)
- ☐ Aquatic Fauna (B13)
- ☐ Marl Deposits (B15)
- ☒ Hydrogen Sulfide Odor (C1)
- ☐ Oxidized Rhizospheres on Living Roots (C3)
- ☐ Presence of Reduced Iron (C4)
- ☐ Recent Iron Reduction in Tilled Soils (C6)
- ☐ Thin Muck Surface (C7)
- ☐ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- ☐ Surface Soil Cracks (B6)
- ☐ Drainage Patterns (B10)
- ☐ Moss Trim Lines (B16)
- ☐ Dry-Season Water Table (C2)
- ☐ Saturation Visible on Aerial Imagery (C9)
- ☐ Stunted or Stressed Plants (D1)
- ☐ Geomorphic Position (D2)
- ☐ Shallow Aquitard (D3)
- ☐ Microtopographic Relief (D4)
- ☐ FAC-Neutral Test (D5)

Field Observations:

- Surface Water Present? Yes ☐ No ☒ Depth (inches): _____
- Water Table Present? Yes ☐ No ☒ Depth (inches): _____
- Saturation Present? Yes ☒ No ☐ Depth (inches): 5cm

Wetland Hydrology Present? Yes ☒ No ☐

WETLAND DELINEATION DATA FORM – NOVA SCOTIA

Project/Site: Black Point Municipality/County: Guysborough Sampling Date: Aug. 20/14
 Applicant/Owner: W. W. W. Sampling Point: W26-WP1
 Investigator(s): S. Bulley Affiliation: AMEC
 Landform (hillslope, terrace, etc.): _____ Local relief (concave, convex, none): _____
 Slope (%): 2 Lat: 45 703 Long: 50 3752 Datum: NAD 83
 Soil Map Unit Name/Type: _____ Wetland Type: Riparian Forest

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ☒ No _____ (If no, explain in Remarks.)
 Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ☒ No _____
 Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes <input checked="" type="checkbox"/> No _____	Is the Sampled Area within a Wetland? Yes <input checked="" type="checkbox"/> No _____
Hydric Soil Present?	Yes <input checked="" type="checkbox"/> No _____	
Wetland Hydrology Present?	Yes <input checked="" type="checkbox"/> No _____	
Remarks: (Explain alternative procedures here or in a separate report.)		

VEGETATION – Use scientific names of plants.

SOIL

Sampling Point: W26-001

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix		Redox Features				Texture	Remarks
	Color (moist)	%	Color (moist)	%	Type ¹	Loc ²		
0-10							organic	peat

¹Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. ²Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators:

- ☒ Histosol (A1)
☐ Histic Epipedon (A2)
☐ Black Histic (A3)
☒ Hydrogen Sulfide (A4)
☐ Stratified Layers (A5)
☐ Depleted Below Dark Surface (A11)
☐ Thick Dark Surface (A12)
☐ Sandy Mucky Mineral (S1)
☐ Sandy Gleyed Matrix (S4)

- ☐ Sandy Redox (S5)
☐ Polyvalue Below Surface (S8)
☐ Thin Dark Surface (S9)
☐ Loamy Gleyed Matrix (F2)
☐ Depleted Matrix (F3)
☐ Redox Dark Surface (F6)
☐ Depleted Dark Surface (F7)
☐ Redox Depressions (F8)

Indicators for Problematic Hydric Soils³:

- ☐ Coast Prairie Redox (A16)
☐ 5 cm Mucky Peat or Peat (S3)
☐ Iron-Manganese Masses (F12)
☐ Piedmont Floodplain Soils (F19)
☐ Red Parent Material (TF2)
☐ Other (Explain in Remarks)

³Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if observed):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ☒ No ☐

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one is required; check all that apply)

- ☐ Surface Water (A1)
☐ High Water Table (A2)
☒ Saturation (A3)
☐ Water Marks (B1)
☐ Sediment Deposits (B2)
☐ Drift Deposits (B3)
☐ Algal Mat or Crust (B4)
☐ Iron Deposits (B5)
☐ Inundation Visible on Aerial Imagery (B7)
☐ Sparsely Vegetated Concave Surface (B8)

- ☐ Water-Stained Leaves (B9)
☐ Aquatic Fauna (B13)
☐ Marl Deposits (B15)
☒ Hydrogen Sulfide Odor (C1)
☐ Oxidized Rhizospheres on Living Roots (C3)
☐ Presence of Reduced Iron (C4)
☐ Recent Iron Reduction in Tilled Soils (C6)
☐ Thin Muck Surface (C7)
☐ Other (Explain in Remarks)

Secondary Indicators (minimum of two required)

- ☐ Surface Soil Cracks (B6)
☐ Drainage Patterns (B10)
☐ Moss Trim Lines (B16)
☐ Dry-Season Water Table (C2)
☐ Saturation Visible on Aerial Imagery (C9)
☐ Stunted or Stressed Plants (D1)
☐ Geomorphic Position (D2)
☐ Shallow Aquitard (D3)
☐ Microtopographic Relief (D4)
☐ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ☐ No ☒ Depth (inches): _____
 Water Table Present? Yes ☒ No ☐ Depth (inches): 33cm
 Saturation Present? Yes ☒ No ☐ Depth (inches): 3cm
 (includes capillary fringe)

Wetland Hydrology Present? Yes ☒ No ☐

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

SECTION SIX: WATER QUALITY									
1	Stormwater/Wastewater/Agricultural runoff as water source?	High		Med		Low			
2	Nutrients/sediments from surrounding land	High		Med		Low			
3	Significant flood/stormwater attenuation	Yes	No						
4	Vegetation capacity to settle suspended sediments	High		Med		Low			
5	WL type /landscape position holds/filters runoff?	Yes	No						
SF16	Wetland improves water quality?	Yes	No						
SF17	Evidence of excess nutrient loading/contamination?	Low	Med	High					
SF18	WL contributes to water quality in downstream resources	High	Med	Low					
SECTION SEVEN: GROUNDWATER INTERACTIONS									
1	Describe soils in wetland	Recharge		Discharge					
2	Land use / run off in subwatershed upstream	Recharge		Discharge					
3	Conditions of upland soils within 200m of wetland	Recharge		Discharge					
4	Hydroperiod of wetland	Recharge		Discharge					
5	Describe inlet/outlet configuration	Recharge		Discharge					
6	Characterize topographic relief surrounding wetland	Recharge		Discharge					

SF19	WL serves as a recharge site	Yes	No	Possible recharge wetland			
SF20	WL serves as a discharge site	Yes	No				
SECTION EIGHT: SHORELINE STABILIZATION AND INTEGRITY							
1	Wetland fringing ocean/estuary/lake/pond/river/stream?	Yes	No	streamwidth >4m	streamwidth <4m	WB Exposed	WB Sheltered
2	% cover of rooted vegetation in shallow water zone	H >50%	M 10-50	L <10%			
3	Avg veg WL width b/w shoreline/streambank & 2 m depth contour	H >10m	M 3-10	L <3m			
4	Prevalence of strong-stemmed emerg. veg (shoreline marshes and fens only)	High	Med	Low			
5	Describe shoreline erosion potential	High	Med	Low			
6	Shoreline/streambank veg condition upslope of water level	Low	Med	High	Artificial		
SF21	WL ability to stabilize shoreline	H	M	L	N/A		
SECTION NINE: PLANT COMMUNITY							
1	Vegetation diversity	High	Med	Low			
1b	Dominant plant species and % cover in the WL	list: <i>Gaylussacia baccata</i> (60%)/ <i>Trichophorum caespitosus</i> (20%)					
3	Dominant Non-native or Invasive species and % cover	Yes	No	specify: %			
4	Vegetation Disturbance	H	M	L	specify type(s) below		
5	Disturbance Types	H, ATV, G, M, In, D/D, Im, OAH, li, Sd, E, other					
7	Vegetative Integrity of plant community	E	H	M	L		
SF22	Is the plant community unique or rare regionally or provincially?	Yes	No	specify:			
SF23	Does the WL contain a diversity of plant communities	H	M	L			
SF24	Rate the overall integrity/quality of plant community?	H	M	L			
SF25	Are there any observed rare or endangered plant species? Specify. <i>C.stygia</i>	End	Thr	SpC	Red	Yellow	S1 S2 S3 N/A
SECTION TEN: FISH AND WILDLIFE HABITAT AND INTEGRITY							
1	Interspersion of open water and vegetation (open water types only)	H	M	L			
1b	% cover in vegetation versus open water	95 %					
2	Interspersion that best fits entire wetland	H	M	L	N/A		
3	Wetland condition related to detritus	H	M	L	N/A		
4	Interspersion of other wetlands in vicinity	H	M	L			
6	Barriers/restriction between wetland and other habitat	L	M	H			
7	Noteworthy wildlife or evidence (birds, mammals, amphibians, etc)	Yes	No	list: Passerines, Deer			
8	Connected to permanent water (accessible to fish)?	Exceptional	High	Med	Low	N/A	
9	Fish species observed or evidence seen (list)	Yes	No	list:			
10	Wetland part of contiguous upland or wetland:	>50ha	25-50ha	10-25ha	<10h		
11	WL provides habitat for:	Amphibians	Reptiles	Waterfowl	Waterbirds	Mammals	Fish R/E species
SF26	Does wetland support fish/fish habitat?	Yes	No	specify:			
SF27	Rare or endangered fish/wildlife species found in the wetland?	End	Thr-SARA	SpC	Red	Yellow	S1 S2 S3 N/A
SF28	Overall fish and wildlife habitat quality	H	M	L			
SECTION ELEVEN: COMMUNITY USE/VALUE							
1	Describe community use	VV, CP, CO, PO, PA, AV, x, GB, E, HI, WV, BO, HU, PG, x, BP, x, F, E, R, Other:					
SF29	Rate the wetland's community use/value	H	M	L			

SF ratings highlighted in red indicate critical wetland functions or watershed conditions that are highly degraded. Whenever a wetland is found to have red-highlighted SFs the proponent

9	Capacity of WL to alter/retard flows	High		Med		Low				
10	Roughness coefficient for surface water flow path	High		Med		Low				
11	Stormwater/Wastewater/Agricultural runoff detention	High		Med		Low				
12	Water Source	Natural		Mostly natural		Partly altered	Controlled			
13	Hydrology of tidal wetlands	Unrestricted		Reduced		Restricted	N/A			
14	Coastal storm surge	Yes	No							
SF13	WL hydrologic condition	Natural	Modified	Significantly Modified						
SF14	WL important for maintaining stream flow?	Yes	No							
SF15	WL ability to detain surface water	High	Med	Low						
SECTION SIX: WATER QUALITY										
1	Stormwater/Wastewater/Agricultural runoff as water source?	High		Med		Low				
2	Nutrients/sediments from surrounding land	High		Med		Low				
3	Significant flood/stormwater attenuation	Yes	No							
4	Vegetation capacity to settle suspended sediments	High		Med		Low				
5	WL type /landscape position holds/filters runoff?	Yes	No							
SF16	Wetland improves water quality?	Yes	No							
SF17	Evidence of excess nutrient loading/contamination?	Low	Med	High						
SF18	WL contributes to water quality in downstream resources	High	Med	Low						
SECTION SEVEN: GROUNDWATER INTERACTIONS										
1	Describe soils in wetland	Recharge		Discharge						
2	Land use / run off in subwatershed upstream	Recharge		Discharge						
3	Conditions of upland soils within 200m of wetland	Recharge		Discharge						
4	Hydroperiod of wetland	Recharge		Discharge						
5	Describe inlet/outlet configuration	Recharge		Discharge						
6	Characterize topographic relief surrounding wetland	Recharge		Discharge						

SF19	WL serves as a recharge site	Yes	No						
SF20	WL serves as a discharge site	Yes	No						
SECTION EIGHT: SHORELINE STABILIZATION AND INTEGRITY									
1	Wetland fringing ocean/estuary/lake/pond/river/stream?	Yes	No	streamwidth >4m	streamwidth <4m	WB Exposed	WB Sheltered		
2	% cover of rooted vegetation in shallow water zone	H >50%	M 10-50	L <10%					
3	Avg veg WL width b/w shoreline/streambank & 2 m depth contour	H >10m	M 3-10	L <3m					
4	Prevalence of strong-stemmed emerg. veg (shoreline marshes and fens only)	High	Med	Low					
5	Describe shoreline erosion potential	High	Med	Low					
6	Shoreline/streambank veg condition upslope of water level	Low	Med	High	Artificial				
SF21	WL ability to stabilize shoreline	H	M	L	N/A				
SECTION NINE: PLANT COMMUNITY									
1	Vegetation diversity	High	Med	Low					
1b	Dominant plant species and % cover in the WL	list: <i>Gaylussacia baccata</i> (30%)/ <i>Morella pensylvanica</i> (20%)/ <i>Eriophorum virginicum</i> (15%)							
3	Dominant Non-native or Invasive species and % cover	Yes	No	specify: %					
4	Vegetation Disturbance	H	M	L	Specify type(s) below:				
5	Disturbance Types	H __, ATV __, G __, M __, In __, D/D __, Im __, OAH __, li __, Sd __, E __, other __							
7	Vegetative Integrity of plant community	E	H	M	L				
SF22	Is the plant community unique or rare regionally or provincially?	Yes	no	specify:					
SF23	Does the WL contain a diversity of plant communities	H	M	L					
SF24	Rate the overall integrity/quality of plant community?	H	M	L					
SF25	Are there any observed rare or endangered plant species? Specify.	End	Thr	SpC	Red	Yellow	S1	S2	S3 N/A
SECTION TEN: FISH AND WILDLIFE HABITAT AND INTEGRITY									
1	Interspersion of open water and vegetation (open water types only)	H	M	L					
1b	% cover in vegetation versus open water	85 %							
2	Interspersion that best fits entire wetland	H	M	L	N/A				
3	Wetland condition related to detritus	H	M	L	N/A				
4	Interspersion of other wetlands in vicinity	H	M	L					
6	Barriers/restriction between wetland and other habitat	L	M	H					
7	Noteworthy wildlife or evidence (birds, mammals, amphibians, etc)	Yes	No	list: Dragon flies, Passerines					
8	Connected to permanent water (accessible to fish)?	Exceptional	High	Med	Low	N/A			
9	Fish species observed or evidence seen (list)	Yes	No	list:					
10	Wetland part of contiguous upland or wetland:	>50ha	25-50ha	10-25ha	<10h				
11	WL provides habitat for:	Amphibians	Reptiles	Waterfowl	Waterbirds	Mammals	Fish	R/E species	
SF26	Does wetland support fish/fish habitat?	Yes	No	specify:					
SF27	Rare or endangered fish/wildlife species found in the wetland?	End	Thr	SpC	Red	Yellow	S1	S2	S3 N/A
SF28	Overall fish and wildlife habitat quality	H	M	L					
SECTION ELEVEN: COMMUNITY USE/VALUE									
1	Describe community use	VV __, CP __, CO __, PO __, PA __, AV __, GB __, E __, HI __, WV __, BO __, HU __, PG __, BP __, F __, E __, R __, Other:							
SF29	Rate the wetland's community use/value	H	M	L					

SF ratings highlighted in red indicate critical wetland functions or watershed conditions that are highly degraded. Whenever a wetland is found to have red-highlighted SFs the proponent

SF6	Does the WL support commercial/recreational fish/shellfish?	Yes	No						
SF7	Species of concern (Fed/Prov)? Specify. <i>Cladonia stygia</i>	End	Thr - SARA	SpC	Red	Yellow	S1	S2	S3 N/A
SF8	Wetland has conservation/compensation agreements/activity?	Yes	No	specify:					
SF9	Wetland is calcareous fen, black ash or cedar swamp?	Yes	No						
SF10	Within Drinking Water Protected Area (designated watershed/wellfield)	Yes	No	specify:					
SF11	WL within a floodplain and upstream of or within of a populated area?	Yes	No						
SF12	Fed/Prov/Municipal area of interest?	Yes	No	specify:					
SECTION FIVE: HYDROLOGIC CONDITION AND INTEGRITY									
1	Is WL source of stream or headwater(wc order 1 or 2)	Yes	No	Specify:					
2	Is WL geographically isolated?	Yes	No	Specify:					
3	WL ability to maintain characteristic hydrologic regime	High		Med		Low			
4	Water Storage Depth (list % in each class)	>30cm	15-30cm	up to 15cm		No ponding			
5	Signs of surface water retention observed?	SW __ cm, WSL __, WCD __, WM __ cm, SM __ cm, SD __, AD __, ID __, PMT __ x __, AI __, BT __, AR __, Other:							
6	Describe observable/historical anthropogenic sediment delivery	Low		Med		High			
7	Disturbance of WL soils	Low		Med		High			
8	Predominant soils adjacent to WL	Sand		Silt/loam		Clay/bedrock			
9	Capacity of WL to alter/retard flows	High		Med		Low			
10	Roughness coefficient for surface water flow path	High		Med		Low			
11	Stormwater/Wastewater/Agricultural runoff detention	High		Med		Low			
12	Water Source	Natural		Mostly natural		Partly altered		Controlled	
13	Hydrology of tidal wetlands	Unrestricted		Reduced		Restricted		N/A	
14	Coastal storm surge	Yes	No						
SF13	WL hydrologic condition	Natural	Modified		Significantly Modified				
SF14	WL important for maintaining stream flow?	Yes	No						
SF15	WL ability to detain surface water	High	Med	Low					
SECTION SIX: WATER QUALITY									
1	Stormwater/Wastewater/Agricultural runoff as water source?	High		Med		Low			
2	Nutrients/sediments from surrounding land	High		Med		Low			
3	Significant flood/stormwater attenuation	Yes	No						
4	Vegetation capacity to settle suspended sediments	High		Med		Low			
5	WL type /landscape position holds/filters runoff?	Yes	No						
SF16	Wetland improves water quality?	Yes	No						
SF17	Evidence of excess nutrient loading/contamination?	Low	Med	High					
SF18	WL contributes to water quality in downstream resources	High	Med	Low					
SECTION SEVEN: GROUNDWATER INTERACTIONS									
1	Describe soils in wetland	Recharge		Discharge					
2	Land use / run off in subwatershed upstream	Recharge		Discharge					
3	Conditions of upland soils within 200m of wetland	Recharge		Discharge					
4	Hydroperiod of wetland	Recharge		Discharge					
5	Describe inlet/outlet configuration	Recharge		Discharge					
6	Characterize topographic relief surrounding wetland	Recharge		Discharge					

SF19	WL serves as a recharge site	Yes	No	Possible recharge wetland			
SF20	WL serves as a discharge site	Yes	No				
SECTION EIGHT: SHORELINE STABILIZATION AND INTEGRITY							
1	Wetland fringing ocean/estuary/lake/pond/river/stream?	Yes	No	streamwidth >4m	streamwidth <4m	WB Exposed	WB Sheltered
2	% cover of rooted vegetation in shallow water zone	H >50%	M 10-50	L <10%			
3	Avg veg WL width b/w shoreline/streambank & 2 m depth contour	H >10m	M 3-10	L <3m			
4	Prevalence of strong-stemmed emerg. veg (shoreline marshes and fens only)	High	Med	Low			
5	Describe shoreline erosion potential	High	Med	Low			
6	Shoreline/streambank veg condition upslope of water level	Low	Med	High	Artificial		
SF21	WL ability to stabilize shoreline	H	M	L	N/A		
SECTION NINE: PLANT COMMUNITY							
1	Vegetation diversity	High	Med	Low			
1b	Dominant plant species and % cover in the WL	list: <i>Gaylussacia baccata</i> (30%)/ <i>Nemopantes mucronata</i> (15%)					
3	Dominant Non-native or Invasive species and % cover	Yes	No	specify: %			
4	Vegetation Disturbance	H	M	L	specify type(s) below		
5	Disturbance Types	H, ATV, G, M, In, D/D, Im, OAH, li, Sd, E, other					
7	Vegetative Integrity of plant community	E	H	M	L		
SF22	Is the plant community unique or rare regionally or provincially?	Yes	no	specify:			
SF23	Does the WL contain a diversity of plant communities	H	M	L			
SF24	Rate the overall integrity/quality of plant community?	H	M	L			
SF25	Are there any observed rare or endangered plant species? Specify. <i>C.stygia</i>	End	Thr	SpC	Red	Yellow	S1 S2 S3 N/A
SECTION TEN: FISH AND WILDLIFE HABITAT AND INTEGRITY							
1	Interspersion of open water and vegetation (open water types only)	H	M	L			
1b	% cover in vegetation versus open water	100 %					
2	Interspersion that best fits entire wetland	H	M	L	N/A		
3	Wetland condition related to detritus	H	M	L	N/A		
4	Interspersion of other wetlands in vicinity	H	M	L			
6	Barriers/restriction between wetland and other habitat	L	M	H			
7	Noteworthy wildlife or evidence (birds, mammals, amphibians, etc)	Yes	No	list: Passerines, Rabbit droppings			
8	Connected to permanent water (accessible to fish)?	Exceptional	High	Med	Low	N/A	
9	Fish species observed or evidence seen (list)	Yes	No	list:			
10	Wetland part of contiguous upland or wetland:	>50ha	25-50ha	10-25ha	<10h		
11	WL provides habitat for:	Amphibians	Reptiles	Waterfowl	Waterbirds	Mammals	Fish R/E species
SF26	Does wetland support fish/fish habitat?	Yes	No	specify:			
SF27	Rare or endangered fish/wildlife species found in the wetland?	End	Thr-SARA	SpC	Red	Yellow	S1 S2 S3 N/A
SF28	Overall fish and wildlife habitat quality	H	M	L			
SECTION ELEVEN: COMMUNITY USE/VALUE							
1	Describe community use	VV, CP, CO, PO, PA, AV, GB, E, HI, WV, BO, HU, PG, BP, F, E, R, Other:					
SF29	Rate the wetland's community use/value	H	M	L			

SF ratings highlighted in red indicate critical wetland functions or watershed conditions that are highly degraded. Whenever a wetland is found to have red-highlighted SFs the proponent

SF1	Watershed condition	H	M	L							
SF2	Proportion of WL area in watershed & opportunity for floodwater detention	H	M	L							
SECTION TWO: WETLAND CHARACTERISTICS											
Wetland Type: Fen		WL size: 0.1 hectares				Landform: Slope		Landscape Position: Lotic Stream Confined			
Water flow path: Throughflow		Wetland Origin: Natural									
1	Water Regime	PF	SF	TF	SS	PS	RfT	lft	AF		
2	# WL's within 30m project area	Total# 0	SM:	BO:	FE:	FM:	FS:	SS:	CP:	VP:	
3	Is WL part of complex	Yes	No								
4	% each wetland type in complex	SM:	BO:	FE: 100	FM:	FS:	SS:	CP:	VP:		
5	Is WL bordering or associated with a lake or pond?	bordering		within 100m		N/A			specify		
6	Standing water?	Yes	Avg Dep:	% Inundated:		No					
7	Inlet or Outlet (circle all that apply)?	Inlet	Outlet								
8	Adjacent Upland Land Use within 100m (%)	For: 95	Nat:	PasHay:	Crop:	UrbCm:	Road:	Other Dev:		5% beach	
9	Are there stressors in WL or WL buffer area? Circle primary stressor(s).	DD_, CW_, WcS_, O/C_, EB_, DP_, F_, M_, ES_, NE_, DwP_, M_, GC_, ATV_, DG_, EA_, R_, Rr_, U/CD_, F_, FA_, other (specify): Skidder trail through wetland									
10	Hydrology Altered (circle all that apply)?	Ditching	Dams	Tiles	Culvert	Well	Diversion	Other Specify:			
SF3	Rate the general wetland condition/integrity	H	M	L							
SECTION THREE: ADJACENT LAND CONDITION AND INTEGRITY											
1	Average width of adjacent naturalized buffer	>1000_m									
2	Widths for water quality	H >1	M 8-15	L <8							
3	Widths for wildlife habitat	H >100	M 15-100	L <15							
4	Adjacent area vegetation condition (list % in each category)	H 100%	M	L							
5	Adjacent area diversity and structure (list % in each category)	H 100%	M	L							
6	Adjacent Upland Slope (list % in each category)	Steep 70%	Mod 25%	Gentle 5%							
7	Adjacent land supports water quality	Yes	No	Specify:							
8	Adjacent land supports wildlife habitat	Yes	No	Specify:							
SF4	Rate the overall condition and integrity land adjacent to wetland	H	M	L	is buffer required to maintain red flag functions of wetland? If yes if no						
SECTION FOUR: DOCUMENTED IMPORTANT FEATURES											
SF5	Is the WL a WSS?	Yes	No								

SF6	Does the WL support commercial/recreational fish/shellfish?	Yes	No						
SF7	Species of concern (Fed/Prov)? Specify.	End	Thr - SARA	SpC	Red	Yellow	S1	S2	S3
SF8	Wetland has conservation/compensation agreements/activity?	Yes	No	specify:					N/A
SF9	Wetland is calcareous fen, black ash or cedar swamp?	Yes	No						
SF10	Within Drinking Water Protected Area (designated watershed/wellfield)	Yes	No	specify:					
SF11	WL within a floodplain and upstream of or within of a populated area?	Yes	No						
SF12	Fed/Prov/Municipal area of interest?	Yes	No	specify:					
SECTION FIVE: HYDROLOGIC CONDITION AND INTEGRITY									
1	Is WL source of stream or headwater(wc order 1 or 2)	Yes	No	Specify:					
2	Is WL geographically isolated?	Yes	No	Specify:					
3	WL ability to maintain characteristic hydrologic regime	High		Med		Low			
4	Water Storage Depth (list % in each class)	>30cm	15-30cm	up to 15cm		No ponding			
5	Signs of surface water retention observed?	SW_20_cm, WSL_, WCD_, WM_cm, SM_cm, SD_, AD_, ID_, PMT_x_, AI_, BT_, AR_, Other:							
6	Describe observable/historical anthropogenic sediment delivery	Low		Med		High			
7	Disturbance of WL soils	Low		Med		High			
8	Predominant soils adjacent to WL	Sand		Silt/loam		Clay/bedrock			
9	Capacity of WL to alter/retard flows	High		Med		Low			
10	Roughness coefficient for surface water flow path	High		Med		Low			
11	Stormwater/Wastewater/Agricultural runoff detention	High		Med		Low			
12	Water Source	Natural		Mostly natural		Partly altered		Controlled	
13	Hydrology of tidal wetlands	Unrestricted		Reduced		Restricted		N/A	
14	Coastal storm surge	Yes	No						
SF13	WL hydrologic condition	Natural	Modified		Significantly Modified				
SF14	WL important for maintaining stream flow?	Yes	No						
SF15	WL ability to detain surface water	High	Med	Low					
SECTION SIX: WATER QUALITY									
1	Stormwater/Wastewater/Agricultural runoff as water source?	High		Med		Low			
2	Nutrients/sediments from surrounding land	High		Med		Low			
3	Significant flood/stormwater attenuation	Yes	No						
4	Vegetation capacity to settle suspended sediments	High		Med		Low			
5	WL type /landscape position holds/filters runoff?	Yes	No						
SF16	Wetland improves water quality?	Yes	No						
SF17	Evidence of excess nutrient loading/contamination?	Low	Med	High					
SF18	WL contributes to water quality in downstream resources	High	Med	Low					
SECTION SEVEN: GROUNDWATER INTERACTIONS									
1	Describe soils in wetland	Recharge		Discharge					
2	Land use / run off in subwatershed upstream	Recharge		Discharge					
3	Conditions of upland soils within 200m of wetland	Recharge		Discharge					
4	Hydroperiod of wetland	Recharge		Discharge					
5	Describe inlet/outlet configuration	Recharge		Discharge					
6	Characterize topographic relief surrounding wetland	Recharge		Discharge					

SF19	WL serves as a recharge site	Yes	No						
SF20	WL serves as a discharge site	Yes	No						
SECTION EIGHT: SHORELINE STABILIZATION AND INTEGRITY									
1	Wetland fringing ocean/estuary/lake/pond/river/stream?	Yes	No	streamwidth >4m	streamwidth <4m	WB Exposed	WB Sheltered		
2	% cover of rooted vegetation in shallow water zone	H >50%	M 10-50	L <10%					
3	Avg veg WL width b/w shoreline/streambank & 2 m depth contour	H >1m	M 3-10	L <3m					
4	Prevalence of strong-stemmed emerg. veg (shoreline marshes and fens only)	High	Med	Low					
5	Describe shoreline erosion potential	High	Med	Low					
6	Shoreline/streambank veg condition upslope of water level	Low	Med	High	Artificial				
SF21	WL ability to stabilize shoreline	H	M	L	N/A				
SECTION NINE: PLANT COMMUNITY									
1	Vegetation diversity	High	Med	Low					
1b	Dominant plant species and % cover in the WL	list: <i>Osmunda cinnamomea</i> (30%)/ <i>Calamagrostis</i> (40%)/ <i>Oclemena nemoralis</i> (20%)							
3	Dominant Non-native or Invasive species and % cover	Yes	No	specify: %					
4	Vegetation Disturbance	H	M	L	specify type(s) below				
5	Disturbance Types	H __, ATV __, G __, M __, In __, D/D __, Im __, OAH __, li __, Sd __, E __, other __							
7	Vegetative Integrity of plant community	E	H	M	L				
SF22	Is the plant community unique or rare regionally or provincially?	Yes	no	specify:					
SF23	Does the WL contain a diversity of plant communities	H	M	L					
SF24	Rate the overall integrity/quality of plant community?	H	M	L					
SF25	Are there any observed rare or endangered plant species? Specify.	End	Thr	SpC	Red	Yellow	S1	S2	S3 (N/A)
SECTION TEN: FISH AND WILDLIFE HABITAT AND INTEGRITY									
1	Interspersion of open water and vegetation (open water types only)	H	M	L					
1b	% cover in vegetation versus open water	95 %							
2	Interspersion that best fits entire wetland	H	M	L	N/A				
3	Wetland condition related to detritus	H	M	L	N/A				
4	Interspersion of other wetlands in vicinity	H	M	L					
6	Barriers/restriction between wetland and other habitat	L	M	H					
7	Noteworthy wildlife or evidence (birds, mammals, amphibians, etc)	Yes	No	list: Passerines, Deer tracks, Leopard Frog					
8	Connected to permanent water (accessible to fish)?	Exceptional	High	Med	Low	N/A			
9	Fish species observed or evidence seen (list)	Yes	No	list:					
10	Wetland part of contiguous upland or wetland:	>50ha	25-50ha	10-25ha	<10h				
11	WL provides habitat for:	Amphibians	Reptiles	Waterfowl	Waterbirds	Mammals	Fish	R/E species	
SF26	Does wetland support fish/fish habitat?	Yes	No	specify:					
SF27	Rare or endangered fish/wildlife species found in the wetland?	End	Thr-SARA	SpC	Red	Yellow	S1	S2	S3 (N/A)
SF28	Overall fish and wildlife habitat quality	H	M	L					
SECTION ELEVEN: COMMUNITY USE/VALUE									
1	Describe community use	VV __, CP __, CO __, PO __, PA __, AV __, GB __, E __, HI __, WV __, BO __, HU __, PG __, BP __, F __, E __, R __, Other:							
SF29	Rate the wetland's community use/value	H	M	L					

SF ratings highlighted in red indicate critical wetland functions or watershed conditions that are highly degraded. Whenever a wetland is found to have red-highlighted SFs the proponent

APPENDIX E
Additional Delineation Data Sheets

Wetland 1

Two streams feed into this large beaver pond from the north. The wetland surrounding the pond is narrow and in some cases non-existent due to steep rock outcrops at the edge of the water. The beaver dam is at the southern end of the open water. Forested wetland is present at the bottom of a steep slope in the southern quadrant near the power line and riparian shrub wetland is associated with both streams.

Open water seen from the south with some riparian Shrub Wetland

Beaver dam seen from the north.

Beaver lodge

Forested Wetland at Wetland 1

Upland habitat adjacent to Forested Wetland at the base of the steep incline at Wetland 1

Shrub Riparian Wetland where Wetland 1 joins Wetland 17

Wetland 2

Wetland 2 is a complex of habitat types including marsh, swamp, forested wetland and riparian wetland. This delineation was problematic because of transitional habitat which stretched between the two coastlines behind the headland. Historic habitation was also present but had little effect on wetland habitat although some fern-dominated wet meadow habitat was identified in isolated areas. Some microtopographical relief was present along the western and southern edges of the complex. Open water was found not to be brackish.

Seepy fern-dominated slope near western wetland edge

Upland habitat near wetland 2 dominated by coniferous forest

Transitional wetland habitat dominated by shrubs and blown down conifers behind the headland west of the main estuary

Upland near Wetland 2

Marshy fen portion of the Wetland 2 complex

C 1340-1675

Hydrology

Wetland 3

Wetland 3 is a fen dominated by typical bog/fen species of wetland plants and surrounded by steep rock outcroppings covered with a thin layer of organic soil. A small stream runs along the side of the wetland at the base of one of these steep banks and some transitional shrub wetland occupies the edge of the clearing.

Open Fen at Wetland 3

Shrub cover and small stream flowing along the edge of wetland 3

Wetland 4

Wetland 4 is a Forested Wetland dominated by Red Spruce (*Picea rubens*) and with an open understory dominated mostly by Sphagnum and by only a few species of herbs and shrubs. This is a relatively small wetland which has formed amongst the variable contours of bedrock and can be distinguished by the surrounding forest largely by the presence of Sphagnum and organic soils.

Forested Wetland with open understory dominated by few herbaceous plant species and abundant mosses

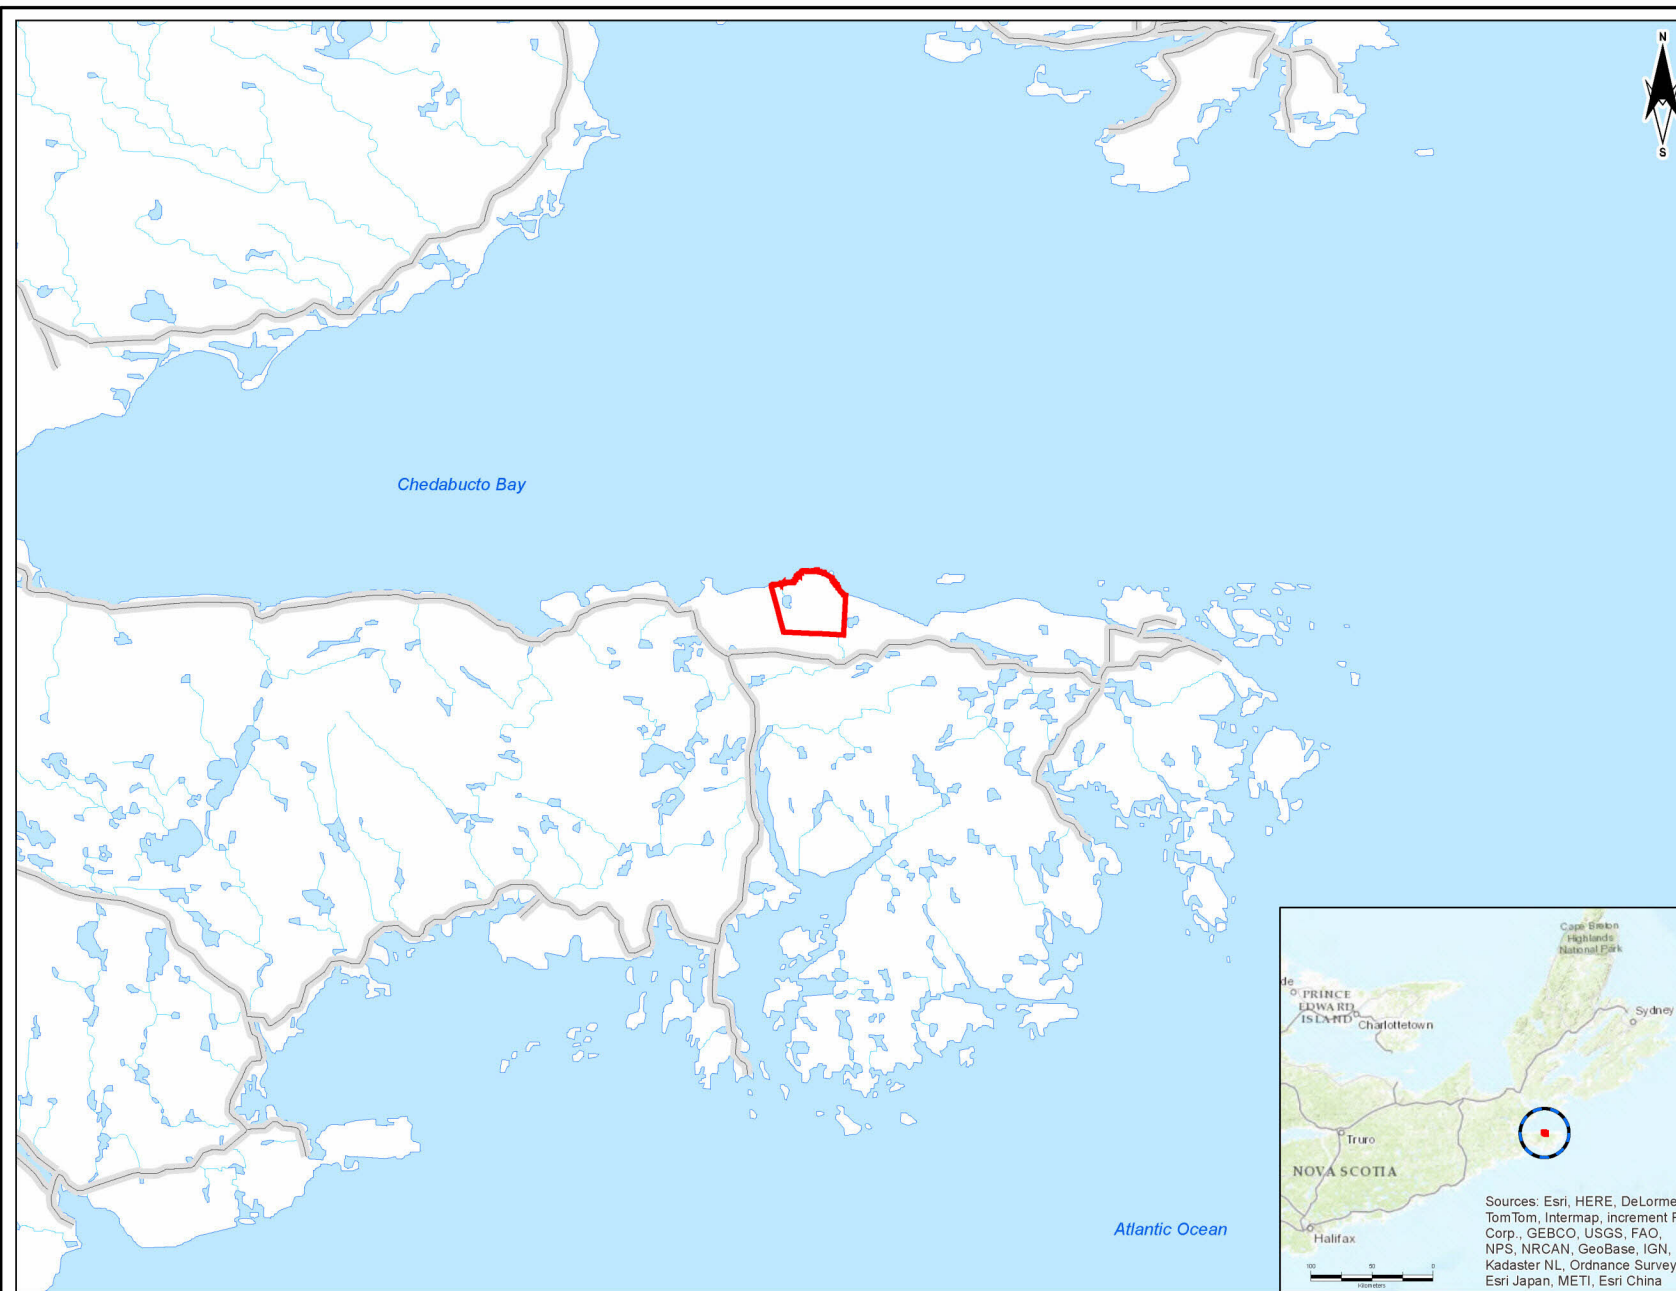

Forested Wetland and adjacent upland differ in hydrology, soil profile and bryophyte flora

APPENDIX G
AECOM 2011 Winter Bird Survey

Black Point Quarry Project
Guysborough County, NS
SLR Project No.: 210.05913.00000

Memorandum

To	Mark Davies, Erdene	Page	1
CC			
Subject	Winter Bird Study Results		
From	Shawn Duncan, Janice Ray, Carrie Bentley, Candace Harding		
Date	February 3, 2011	Project Number	60190702

Background

A desktop exercise to assess the potential for winter birds was conducted for the Erdene Resource Development Corp. (Erdene) Black Point Quarry Project (the 'Project'). Existing baseline data for overwintering and breeding winter birds was collected from the following databases and information sources:

- Atlantic Canada Conservation Data Center (ACCDC) (100 km radius around the proposed Project area);
- The Maritime Breeding Bird Atlas (Guyborough area);
- The Audubon Christmas Bird Count (The Strait of Canso, approximately 30 km from the proposed Project area);
- The Nova Scotia Department of Natural Resources, Wildlife Division Species at Risk; and
- The Nova Scotia Significant Species and Habitat Database.

The results indicated that over 100 bird species could potentially overwinter within or within proximity to the proposed Project area. Seven (7) rare or uncommon bird species returned in the ACCDC search requested in support of this Project which have potential to overwinter within or within proximity to the proposed Project area (Table 1) (ACCDC 2010). In addition to these seven, two winter nesting species, the red crossbill (*Loxia curvirostra*) and the white-winged crossbill (*Loxia leucoptera*) were also identified. Although not provincially or federally ranked, both of these species and their nests are protected under the *Migratory Bird Convention Act*.

Based on the results of the desktop review, a winter bird survey of the Project study area was recommended by AECOM and subsequently authorized by Erdene.

Table 1 Rare or Uncommon Bird Species Potentially Overwintering Within or Within Proximity to the Project Area

Scientific Name	Common Name	ACCDC SRank	NSDNR Rank	SARA Rank	Overwintering Habitat*
<i>Accipiter gentilis</i>	Northern Goshawk	S3S4	YELLOW	-	Forested landscapes
<i>Bucephala clangula</i>	Common Goldeneye	S2B,S5N	GREEN	-	Broad shallow bays and inlets
<i>Calidris maritima</i>	Purple Sandpiper	S3N	YELLOW	-	Rocky shores on the Atlantic and Fundy coasts, and even in the sheltered Minas Basin.
<i>Histrionicus histrionicus</i>	Harlequin Duck	S2N	YELLOW	Special Concern Schedule 1	Wave-lashed coasts and jetties
<i>Icterus galbula</i>	Baltimore Oriole	S2S3B	GREEN	-	Edges of deciduous and mixed wood forests.
<i>Passerculus sandwichensis princeps</i>	Ipswich Sparrow	S1B	YELLOW	-	Outer dune beaches with grass cover and sheltered areas (valleys).
<i>Rissa tridactyla</i>	Black-legged Kittiwake	S2B,S4S5N	GREEN	-	Winters out at sea mainly on offshore waters, but it occasionally comes inshore and even inland as a result of storms at sea.

*Sources: ACCDC 2010; Nova Scotia Museum of Natural History 1998; Species at Risk in Nova Scotia 2008

Notes:

S1 = Extremely rare throughout its range in the province (typically 5 or fewer occurrences or very few remaining individuals). May be especially vulnerable to extirpation; S2 = Rare throughout its range in the province (6 to 20 occurrences or few remaining individuals). May be vulnerable to extirpation due to rarity or other factors; S3 = Uncommon throughout its range in the province, or found only in a restricted range, even if abundant in at some locations. (21 to 100 occurrences); S4 = Usually widespread, fairly common throughout its range in the province, and apparently secure with many occurrences, but the Element is of long term concern (e.g. watch list). (100+ occurrences); S5 = Demonstrably widespread, abundant, and secure throughout its range in the province, S5 and essentially ineradicably under present conditions; S#S# = Numeric range rank: A range between two consecutive numeric ranks. Denotes range of uncertainty about the exact rarity of the Element (e.g., S1S2); SH = Historical: Element occurred historically throughout its range in the province (with expectation that it may be rediscovered), perhaps having not been verified in the past 20 - 70 years (depending on the species), and suspected to be still extant; SU = Unrankable: Possibly in peril throughout its range in the province, but status uncertain; need more information; SX = Extinct/Extirpated: Element is believed to be extirpated within the province; S? = Unranked.B = Breeding: Basic rank refers to the breeding population of the element in the province; N = Non-breeding: Basic rank refers to the non-breeding (usually wintering) population of the element in the province; M = Migratory: Basic rank refers to the migratory stopover population in the province.

Winter Bird Survey Results

Methods

AECOM conducted a winter bird survey within the Project study area on January 18 and 19, 2011 (Appendix A). The surveys were conducted between 8:00 am and 2:30 pm. A total of 13 sites were selected within and within close proximity of the study area (Appendix A: Figure 1). Sites were selected within the different habitat types of potential overwintering bird species within the study area. These habitats included: mature coniferous forest, rocky coast, forest edge, and small spruce and willow. For a minimum of 5 minutes, all species observed or heard were recorded representing 500 m on either side of the observer.

Results

Over the course of the survey, sixteen (16) different bird species were heard or observed (Table 2); none of which are red listed (i.e., known to be, or that is thought to be at risk) by Nova Scotia Department of Natural Resources (NSDNR). Two (2) species identified are yellow listed (i.e., sensitive to human activities or natural events) by NSDNR: the Gray Jay (*Perisoreus canadensis*) and the Boreal Chickadee (*Parus hudsonicus*). No winter breeding birds were observed or heard (i.e., red crossbill and white-winged crossbills).

Table 2 Birds and Mammals Observed or Heard within the Project Area

Scientific Name	Common Name	NSDNR Rank	AC CDC SRank	SARA Rank	Sign Type	Site Number*
<i>Anas platyrhynchos</i>	Mallard	GREEN	S5	-	Sound	S11
<i>Corvus brachyrhynchos</i>	American Crow	GREEN	S5	-	Sound	S2, S5
<i>Corvus corax</i>	Common Raven	GREEN	S5	-	Sound	S4
<i>Haliaeetus leucocephalus</i>	Bald Eagle	GREEN	S4	-	Observation	S11
<i>Larus argentatus</i>	Herring Gull	GREEN	S4S5	-	Sound	S11

Habitat Evaluation of Breeding Birds and Rare Birds

Habitats within the study area include: rocky coast, mature black and red spruce forest, forest edge, small spruce and willow with rocky outcrops, and wetlands (e.g. bog, fen, marsh, swamp, lake).

Although the study area contained adequate habitat for red and white-winged crossbills, the potential for these birds to occur and breed in the study area at the time of assessment was considered to be low due to the lack of adequate food sources (seed bearing cones). The habitat evaluation of rare or uncommon bird species occurring or potentially occurring within or within close proximity to the study area at the time of assessment is described in Table 3 below:

Table 3 Habitat Evaluation and Potential for Rare or Uncommon Bird Species Potentially Overwintering Within or Within Proximity to the Project Area*

Species	Habitat Evaluation in Study Area**	Potential to Occur in Study Area**
Gray Jay (<i>Perisoreus Canadensis</i>)	<u>Good</u> : Owing to the presence of coniferous forest	<u>High</u> : Observed in study area
Boreal Chickadee (<i>Poecile hudsonica</i>)	<u>Good</u> : Owing to the presence of coniferous forest	<u>High</u> : Heard in study area
Northern Goshawk (<i>Accipiter gentilis</i>)	<u>Moderate to Good</u> : Owing to the presence of mature coniferous forest	<u>Low to Moderate</u> : Due to low numbers of mammalian prey
Purple Sandpiper (<i>Calidris maritima</i>)	<u>Moderate to Good</u> : Owing to abundant rocky coast within the study area.	<u>Moderate to High</u> : Owing to sufficient habitat
Harlequin Duck (<i>Histrionicus histrionicus</i>)	<u>Moderate</u> : Owing to the presence of coastal habitat	<u>Moderate</u> : Owing to sufficient habitat
Common Goldeneye (<i>Bucephala clangula</i>)	<u>Poor to Moderate</u> : Due to the presence of some inlets and sheltered areas.	<u>Low to Moderate</u> : Due to only some preferred habitat.
Ipswich Sparrow (<i>Passerculus sandwichensis princeps</i>)	<u>Poor to Moderate</u> : Due to very few areas of sheltered grassy areas	<u>Low to Moderate</u> : Due to few areas of preferred habitat.
Baltimore Oriole (<i>Icterus galbula</i>)	<u>Poor</u> : Due to a lack of deciduous forests	<u>Low</u> : Due to lack of preferred habitat
Black-legged Kittiwake (<i>Rissa tridactyla</i>)	<u>Poor</u> : These birds occur at sea during the winter months and sometimes come to shore during bad weather.	<u>Low</u> : Due to lack of sufficient habitat

*Sources: ACCDC 2010; Nova Scotia Museum of Natural History 1998; Species at Risk in Nova Scotia 2008

**These rankings are based on the study area at the time of assessment.

Signs of Other Wildlife

AECOM observed a lot of coyote (*Canis latrans*) activity (tracks and scat) within the study area. There was little sign (tracks) of white-tailed deer (*Odocoileus virginianus*), snowshoe hare (*Lepus americanus*), red squirrel (*Tamiasciurus hudsonicus*), and vole (sp). No signs of mammal species at risk were observed (e.g. moose, lynx, and marten).

Addendum (2014 12 18)

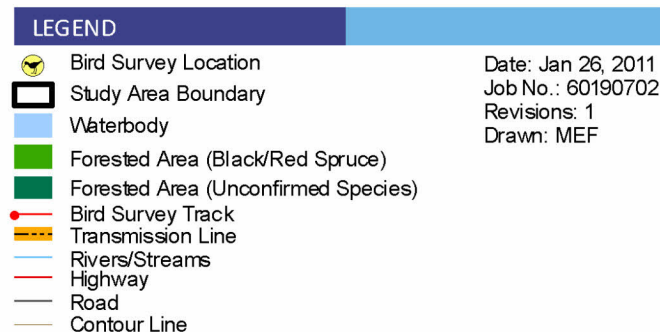

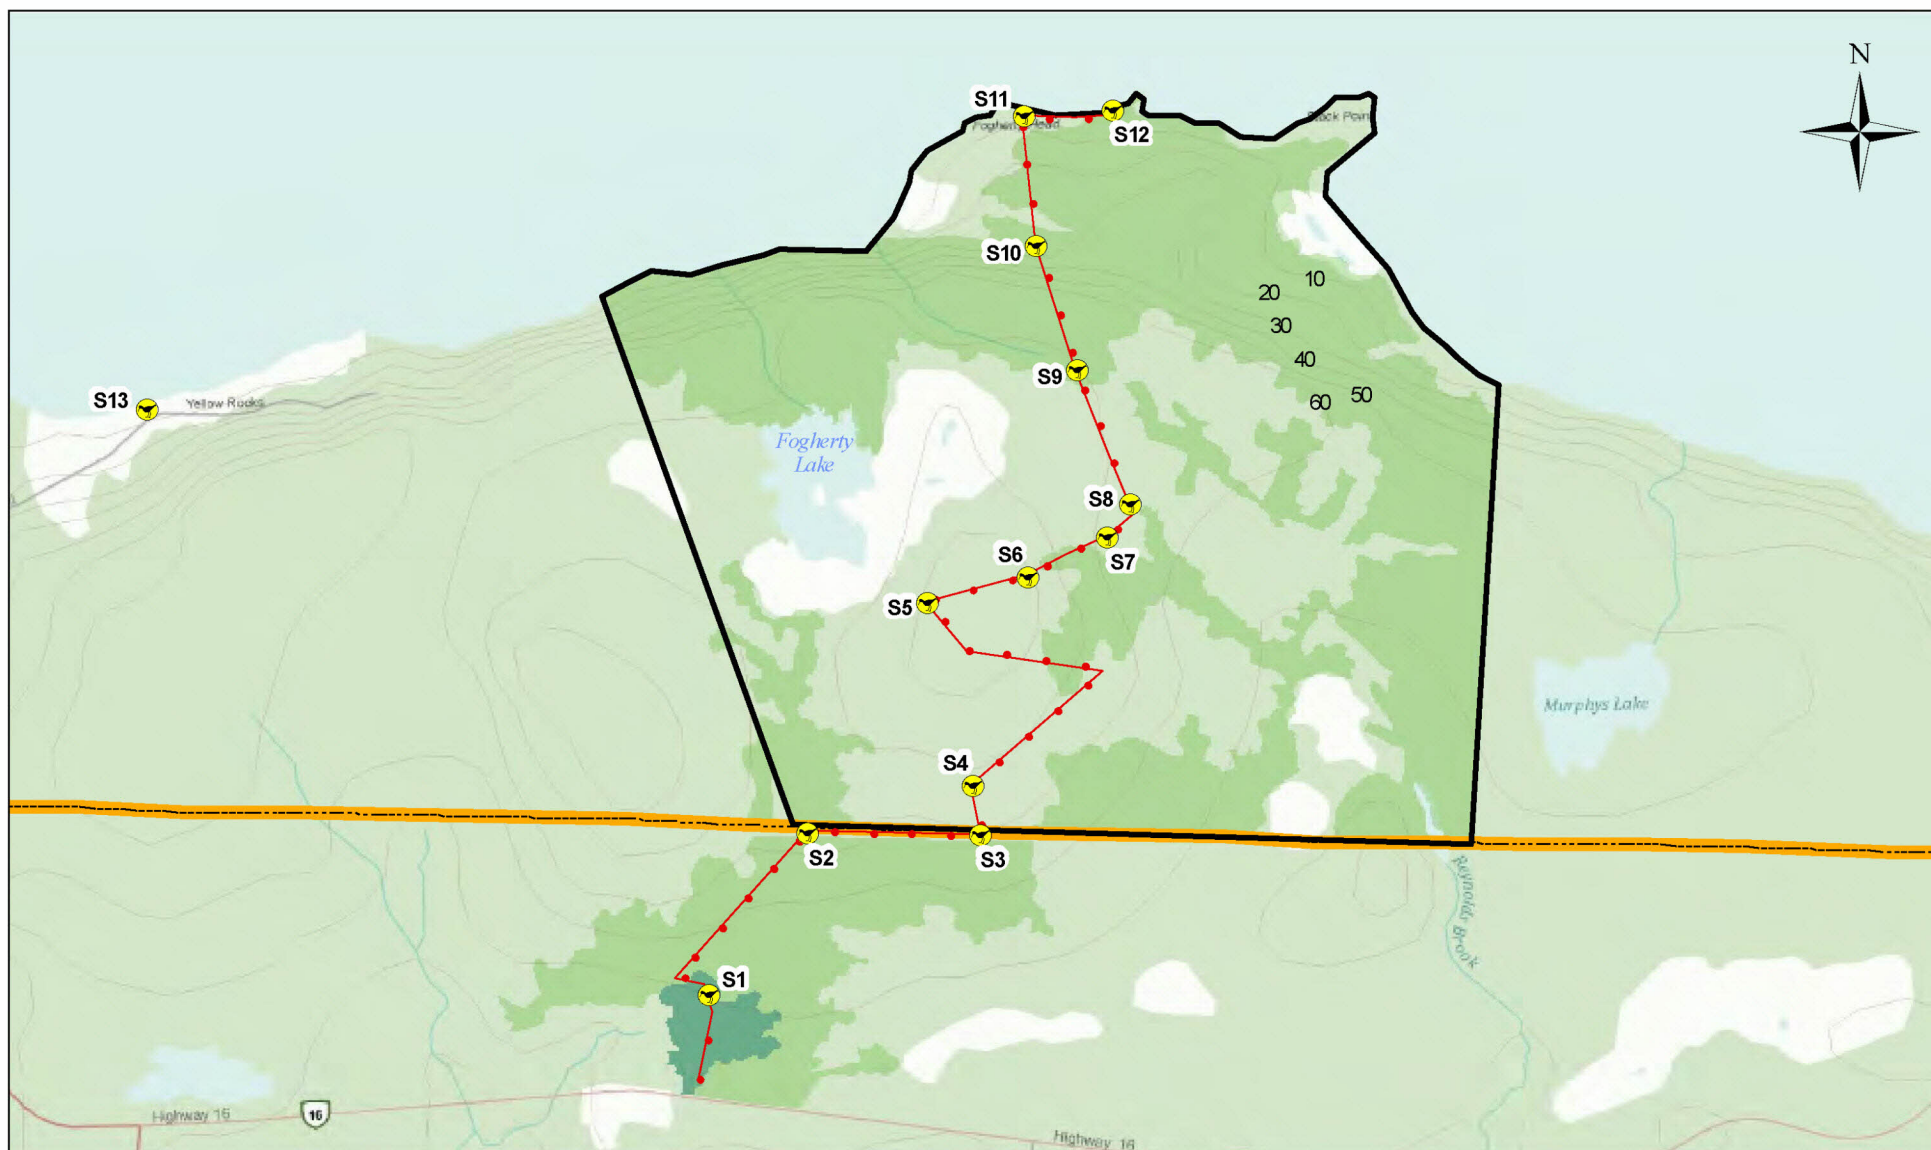

Habitat Based Point Count Methodology

Point count surveys are a common and standard method of determining species abundance in various habitat types (EC and CWS 2007). A habitat-based point count survey was chosen to determine the abundance and presence/absence of bird species in and around the proposed Project site. AECOM conducted a winter bird survey between January 18 and 19, 2011 (Figure 1, Appendix A). On January, 18, twelve (12) point count locations were conducted within the Project study area between 8:00 am and 2:30 pm. On January 19, one point count location was conducted at 10:30 am along the coast within close proximity of the Project study area. Point count locations were selected within the different habitat types of potential overwintering bird species within the study area. These habitats included: mature coniferous forest, rocky coast, forest edge, and small spruce and willow (see photos and habitat map Figure 3). Each station was spaced at least 125m apart; however, a minimum distance of 250m between sites was targeted. For a minimum of 5 minutes, all species observed or heard were recorded.

At each station the following data additional was collected:

- UTM coordinates
- Start time and end time of point count survey
- Date
- Weather conditions (Point Count surveys were not conducted during rain or during wind speeds of >25 km/h).
- Habitat type
- A list of additional species that may have been heard before and after the survey
- Photograph of habitat type
- Name of surveyors

 Black Point Quarry Project

AECOM

Project: Erdene: 60190702

Date: January 18 and 19, 2011

Crew: Maureen Flinn, Candace Harding, Carrie Bentley, Blair George

Distance Traveled:

Potential for Breeding Crossbills: Low due to no sign, not enough food source for breeding

Mammal Sign: Snowshoe hare (2 tracks), Coyote (4 to 6, tracks and scat), White-tailed deer (1 track), Red Squirrel (3 tracks), vole (1 track)

General Comments: Fogerty Lake was iced over which eliminates potential for waterfowl species in the lake. Lots of coyote activity, likely a pack living in area. Low numbers of deer, hare, vole and squirrel. Not many cones on spruce trees.

Low potential for marten, lynx or cougar due to low numbers of prey (hare, squirrel, deer). Moderate potential for moose owing to abundant willow

1.0 INTRODUCTION AND BACKGROUND

Vulcan Materials Company and Morien Resources Corp. (the Proponent) proposes the development, operation, decommissioning and abandonment of a granite quarry and marine terminal at Black Point in Guysborough County, Nova Scotia. The Black Point Quarry Project consists of aggregate production (drilling, blasting, processing and stockpiling) on a 354.5 ha property, along with the construction and operation of a 200 m long marine terminal adjacent to the quarry in Chedabucto Bay. The aggregate will be loaded into bulk carriers up to 70,000 DWT and transported to ports along the US eastern and Gulf coasts and potentially to markets in Canada and the Caribbean.

The Black Point Quarry Project (the Project) is located on the south shore of Chedabucto Bay in the District of Guysborough, Nova Scotia. The proposed Project Site is approximately 2 km from the community of Half Island Cove in the west, and 2.5 km from Fox Island Main in the east. The Project is situated between Highway 16 and the Atlantic coast, in an area dominated by coniferous forests, coastal barrens, as well as various types of wetlands, including bog, fen, swamp and marsh. A power transmission line corridor runs along the south end of the property and with the exception of a few ATV trails, skidder tracks and property cut lines, the area is relatively undisturbed.

Following the discovery of moose sign (tracks and scat) during wetland surveys conducted by AMEC Environment & Infrastructure (AMEC) in August of 2014, discussions were initiated between Mr. Russell Dmytriw of SLR and NSDNR to design a survey plan for mainland moose (*Alces alces americana*). The purpose of the survey was to confirm presence of moose on the site and develop an understanding of the numbers and sex of moose present during the fall rutting season, including which areas and habitats they may be using. The survey is intended to supplement winter track surveys and spring pellet surveys that will be conducted in early 2015. This summary report presents the results of the fall survey for mainland moose conducted in late September 2014 by AMEC.

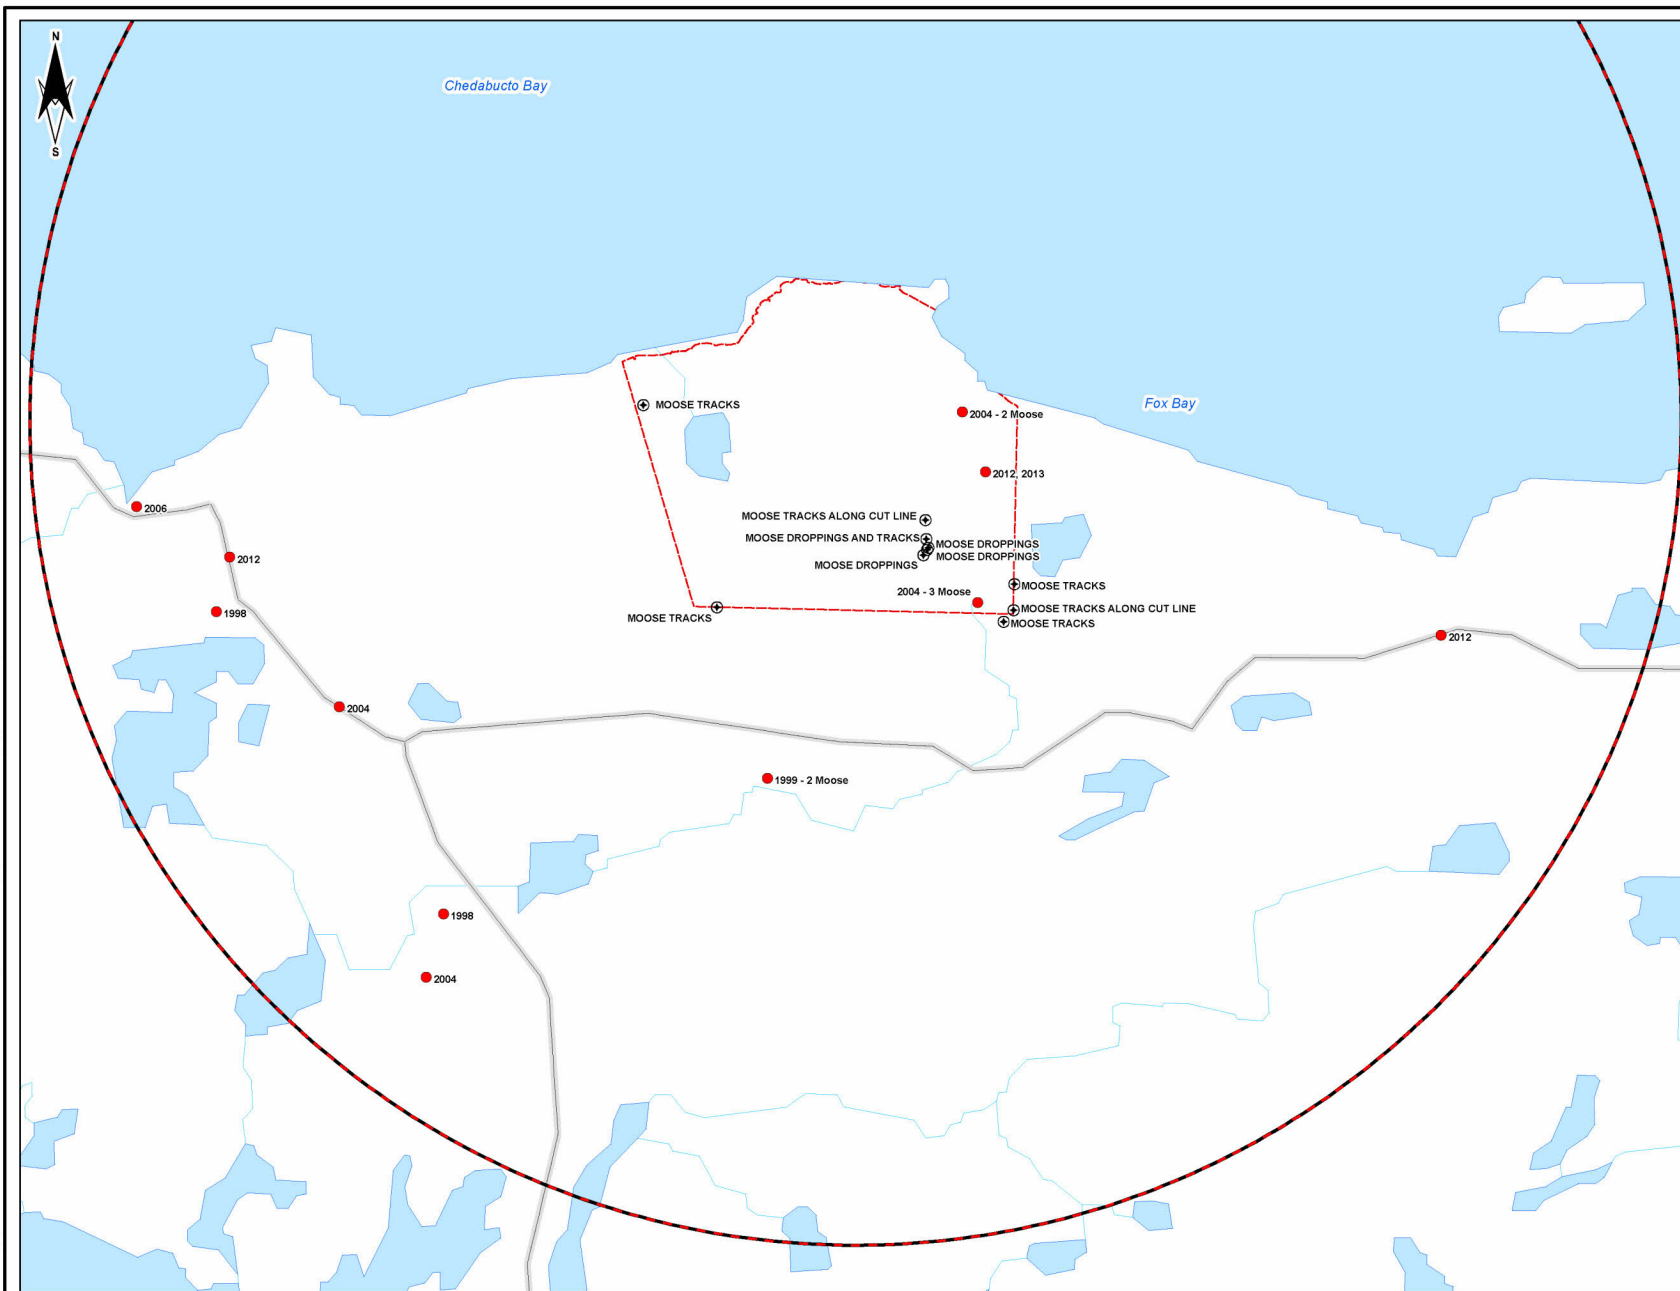

2.0 APPROACH AND METHODOLOGY

For the surveys, an AMEC field biologist familiar with the Project site was accompanied by an experienced moose hunter from the nearby Paq'tnkek First Nation, Mr. Kerry Prosper. Mr. Prosper is a member of the provincial Mainland Moose Recovery Team, who has hunted moose in Cape Breton Island since the mid-1990s and is very familiar with moose tracking and identification of moose sign. Prior to the survey, AMEC field staff reviewed the locations and nature of previous moose sightings reported by NSDNR as well as by AMEC during previous field surveys (August 2014) conducted on site (Figure 2.1 Previous Moose Sightings Within 5 km of Project Location Figure 2.1). The layout of the Project site and the locations of likely suitable habitat were reviewed by all field personnel at the start of the survey program. Survey effort was focussed in areas of high-potential moose habitat on the site, particularly Fogherty Lake and the large bogs near Fogherty Lake (WL11) and on the east side of the property (WL1 and WL14), as well as in likely corridors for moose travel, particularly along the power transmission line and over the barrens between Fogherty Lake and the bogs on the east side of the property.

Surveyors accessed the site from the southwest corner and walked along likely areas of moose corridors, such as the power transmission line along the south of the Project site, carefully looking for signs of moose presence including (but not limited to) tracks, scat, evidence of browsing, and game trails. In areas of suitable moose habitat, including bog edges and the shore of Fogherty Lake, moose calling interspersed with a period of silent observation was conducted over a period of 30 to 90 minutes. Scent markers intended to attract moose were deployed in three locations on the first morning of the survey. Calling stations and scent markers were established in areas where tracks would be evident (e.g. in muddy areas), so that if these sites are visited by moose after the surveyors leave, evidence of moose presence would be obvious upon returning to the location.

In addition to signs of moose, incidental sightings and evidence of other terrestrial fauna were noted, including birds and other mammal species. Efforts were made to detect migrating shorebird species that may utilize the bog and barrens habitats for feeding and staging during high tide; shoreline surveys for shorebirds were conducted in 2010 (AMEC 2014).

3.0 RESULTS AND DISCUSSION

Surveys were conducted during the early and late parts of the day, when moose are most active. On September 24th, surveys were conducted from sunrise to early afternoon, and from late afternoon until shortly after sunset. On September 25th, additional surveys were conducted in the morning to early afternoon, and the previous day's scent marker stations and calling points were examined for evidence of recent moose presence. Weather conditions were favourable on both days of the survey, with cool morning temperatures (approximately 10°C), no precipitation and calm to light breezes. Winds became fairly gusty in the later morning and early afternoon of September 24th; however, moose are less active at this time of day and as such survey effort was focussed on finding moose sign rather than on attempting to attract moose by calling and scent.

3.1 MOOSE OBSERVATIONS

A total of seven calling stations were established and three scent markers were deployed on the Project site (Figure 3.1); however, no moose were observed during the surveys, and no recent evidence of moose was noted when surveyors returned to the calling stations and scent markers. Evidence of past moose presence was noted in the Project site; tracks were observed at several locations, and there was some moose scat and possible scrapes (Figure 3.1). These observations are further discussed below.

Fogherty Lake and WL11

Two areas identified as possible moose scrapes were noted in the area between Fogherty Lake and WL11 (Appendix A, Photo 1); however, Mr. Prosper noted that a tree with rubbed bark would typically be seen in close proximity to a moose scrape, and no such trees were found near either of these locations. These possible scrapes were not recent, and no additional sign was noted in the area. Moose tracks were observed by AMEC northwest of Fogherty Lake in August 2014 (Figure 2.1), indicating that moose occasionally use this part of the Project site.

WL1 and WL14

Moose activity was evident in the bogs in the southeastern portion of the Project site. A trail made by moose was identified in WL1, running in a north-south direction and appearing to link WL1 and WL14 (Appendix A, Photo 2). Because the individual tracks could not be distinguished, the size and number of individuals using the trail could not be estimated; however, Mr. Prosper noted that the trail did not appear to be heavily used. Old moose scat (likely from the previous year) was observed in two locations near WL14 (Appendix A, Photo 3). Although the scat was fairly decomposed, one pile was identified by Mr. Prosper as being from a bull moose.

The majority of sightings of moose tracks and scat by AMEC field personnel in August 2014 were in this southeastern portion of the site (Figure 2.1). The scat observed in August was very recent, indicating that moose were present in the area in late summer.

Barrens

Moose tracks were observed in a few locations in muddy parts of the trail that runs in a north-south direction through the barrens in the centre of the Project site. This open area of barrens could serve as a corridor for moose to move between the areas of potential habitat to the west (Fogherty Lake and associated wetlands) and east (WL1 and WL14) of the Project site. However, the tracks that were seen on the trail were all made by animals travelling along the trail, not across it in an east-west direction (Figure 3.1), suggesting that moose may not be using the barrens as a direct route between these two wetland areas. At least two distinct sets of tracks were observed, one made by an adult bull (Appendix A, Photo 4) and one by a 3 or 4 year old male, but none of the tracks appeared to be recent.

Power Transmission Line

Moose tracks were observed in many locations along the transmission line corridor, all from young (3 to 4 year old) bulls heading in a westerly direction. There were at least two distinct tracks, one set relatively recent (from within a week prior to the survey; Appendix A, Photo 5) and the other set much older. No other evidence of moose presence was observed in this part of the Project site. Notably, no moose trails were observed leading from the transmission line corridor northwards to the wetland areas on the western edge of the Project site (west of Fogherty Lake), suggesting that these wetlands are not frequented by moose.

3.2 INCIDENTAL OBSERVATIONS

White-tailed deer (*Odocoileus virginianus*) tracks and scat were observed at several locations along the transmission line, and a deer was observed in an area of low shrubs near the southwest corner of the Project site. Coyote (*Canis latrans*) scat (old and recent) was observed in several locations. Black bear (*Ursus americanus*) and bobcat (*Lynx rufus*) tracks were also observed along the transmission line, and bear scat was observed in forested habitat near WL14. Snowshoe hare (*Lepus americanus*) scat was seen along the transmission line, and a partial carcass was seen near the southwest corner of the Project site. Raccoon (*Procyon lotor*) tracks were seen along the transmission line, and possible scat was seen on the barrens. Red squirrel (*Tamiasciurus hudsonicus*) was frequently heard throughout the Project site.

The following bird species were seen and/or heard in several locations and are considered to be widespread on the Project site: American Crow (*Corvus brachyrhynchos*), American Goldfinch (*Spinus tristis*), American Robin (*Turdus migratorius*), Black-capped Chickadee (*Poecile atricapillus*), Boreal Chickadee (*Poecile hudsonicus*), Dark-eyed Junco (*Junco hyemalis*), Golden-crowned Kinglet (*Regulus satrapa*), Red-eyed Vireo (*Vireo olivaceus*) and White-throated Sparrow (*Zonotrichia albicollis*). In forested habitat, Blue Jay (*Cyanocitta cristata*), Gray Jay (*Perisoreus canadensis*), Hermit Thrush (*Catharus guttatus*) and Red-breasted Nuthatch (*Sitta canadensis*) were frequently heard, and a flock of 22 Cedar Waxwings (*Bombycilla cedrorum*) was observed near WL1. Near wetlands, Common Yellowthroat (*Geothlypis trichas*) was fairly abundant and Palm Warbler (*Dendroica palmarum*) was observed on a couple of occasions.

Downy Woodpecker (*Picoides pubescens*), Song Sparrow (*Melospiza melodia*) and Swainson's Thrush (*Catharus ustulatus*) were each heard on a single occasion. Common Raven (*Corvus corax*) was occasionally seen flying over the site. An Osprey (*Pandion haliaetus*) was seen flying to the south of the Project area, and two Bald Eagles (*Haliaeetus leucocephalus*; likely a pair) were observed to the northwest of the Project area. An American Kestrel (*Falco sparverius*) was seen hunting over the barrens near the centre of the Project site.

Six Great Cormorants (*Phalacrocorax carbo*) and a single Herring Gull (*Larus argentatus*) flew over the site on September 24th. Fogherty Lake was scanned on several occasions over the two days of the survey, and no waterfowl or shorebirds were observed on or near the waters. The lake does not appear to provide suitable habitat for breeding shorebirds, as the bank vegetation consists of dense low shrubs that overhang the water, and there is no shallow water for wading along the edges. No shorebirds were observed feeding in the barrens and bog habitat, despite the presence of some suitable berries. Fogherty Lake has a very low pH and, based on the results of AMEC surveys conducted in 2010, it does not appear to support fish; therefore it is unlikely to provide nesting habitat for piscivorous species such as loons or kingfishers. Suitable vegetation for dabbling duck species is also absent in the lake.

4.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the observations made during these preliminary surveys, as well as previous observations from NSDNR reports and previous AMEC field surveys, it is evident that moose are occasionally present in the Project area. Efforts to attract moose using auditory and scent attractants were unsuccessful, suggesting that moose may not be presently using the Project location. However, although the rutting season for moose in Nova Scotia is September to October, it is possible that due to the relatively warm temperatures in the days prior to the survey, the moose rutting season was not yet at its peak.

The preliminary survey work suggests that the Project site provides marginal moose habitat. There was very little young hardwood growth, which is a preferred food item for moose (NSDNR 2007), and no sign of browse was observed during the surveys. As well, the moderate ATV use that was evident along the power transmission line would likely discourage moose from the area. Mr. Prosper noted that there are areas of much more suitable habitat nearby (for example, from the higher portions of the site, large bogs could be seen to the south), therefore it is unlikely that moose would reside in the Project area. Most of the tracks seen on the Project site were from young (3 to 4 year old) male moose. Young bulls of this age tend to be driven away from prime habitats by territorial adult bulls.

Based on these preliminary results, it is recommended that winter track and pellet surveys be conducted in order to supplement the understanding of moose presence and abundance on the Project site in different times of year.

Additionally, Mr. Prosper noted that moose would be capable of crossing Chedabucto Bay; therefore, it may be possible that moose in the Project area are from the introduced Cape Breton population rather than the endangered native mainland population. There is evidence that the Cape Breton and mainland moose populations can be distinguished using genetic markers (Ball 2003; cited in NSDNR 2007). If feasible, it may be worthwhile to collect pellets from the Project site that may be used for genetic testing to better understand the knowledge and movement patterns of moose in this area.

WATER FLOW MEASUREMENT

[illegible]

1. Chute water depth equal to or greater than channel width.

Understory Bank. % of bank overhanging (above water edge for stream type. Specify left (L) or right (R))

5 Overhanging Bank Vegetation. % of vegetation overhanging for stream type. Specify L or R

6 Vascular Embankment. % of sward or forest surrounding the larger substrates, up to 100%

7 Woody Debris. total width should be ≥ 10 cm in diameter

*For different left and right parameters, values are to be written as L/R.

Start Point: WPT 171

APPENDIX D

AGAT QA/QC Forms for Freshwater Samples

Black Point Quarry Project
Guysborough County, NS
SLR Project No.: 210.05913.00000

CLIENT NAME: AMEC EARTH AND ENVIRONMENTAL
580 MAIN STREET, SUITE 105
SAINT JOHN, NB E2K1J5

ATTENTION TO: CHYANN KIRBY

PROJECT NO: GRQ

AGAT WORK ORDER: 10X432414

WATER ANALYSIS REVIEWED BY: Mike Earp, Operations Manager

DATE REPORTED: Sep 10, 2010

PAGES (INCLUDING COVER): 8

VERSION*: 1

Should you require any information regarding this analysis please contact your client services representative at (902) 468-8718, or at 1-888-468-8718

*NOTES

All samples will be disposed of within 30 days following analysis. Please contact the lab if you require additional sample storage time.

Certificate of Analysis

AGAT WORK ORDER: 10X432414

*Definitions:

A = Abundant (Numerous (not quantifiable) observations made throughout the entire 5 m segment)

C = Common (Numerous (not quantifiable) observations made intermittently along the 5 m segment)

O = Occasional (Quantifiable observations made intermittently along the 5 m segment)

U = Uncommon (Quantifiable observations made infrequently along the 5 m segment)

---- denotes "no life observed".

*Definitions:

A = Abundant (Numerous (not quantifiable) observations made throughout the entire 5 m segment)**C = Common** (Numerous (not quantifiable) observations made intermittently along the 5 m segment)**= Occasional** (Quantifiable observations made intermittently along the 5 m segment)**U = Uncommon** (Quantifiable observations made infrequently along the 5 m segment)

----- denotes "no life observed".

Table E.1-7. List of Species Observed during Video Transect Survey of Benthic Habitat off Black Point, September 2010.

Marine Fauna	
American Oyster	<i>Crassostrea virginica</i>
Barnacle	<i>Semibalanus balanoides</i>
Blue Mussel	<i>Mytilus edulis</i>
Bowerbank's Halichondria	<i>Halichondria bowerbanki</i>
Cunner	<i>Tautoglabrus adspersus</i>
Frilled Anemone	<i>Metridium senile</i>
Green Sea Urchin	<i>Strongylocentrotus droebachiensis</i>
Lobster	<i>Homarus americanus</i>
Periwinkle	<i>Littorina sp.</i>
Scallop	<i>Placopecten magellanicus</i>
Sea Cucumber	<i>Cucumaria frondosa</i>
Sea Peach	<i>Holacynthia pyriformis</i>
Sea Star	<i>Asterias sp.</i>
Shorthorn Sculpin	<i>Myoxocephalus scorpius</i>
Waved Whelk	<i>Buccinum undatum</i>
Marine Flora	
Black Whip Weed	<i>Chordaria flagelliformis</i>
Bladderwrack	<i>Fucus sp.</i>
Brown alga	<i>Pilayella littoralis</i>
Encrusting Red Alga	<i>Leptophyllum sp.</i>
Green Alga	<i>Acrosiphonia arcta</i>
Green Fleece	<i>Codium fragile</i>
Irish Moss	<i>Chondrus crispus</i>
Kelp	<i>Laminaria saccharina</i>
Red Alga	<i>Plumaria plumosa</i>
Sea Colander	<i>Agarum clathratum</i>
Tube Weed	<i>Polysiphonia lanosa</i>

Fish Community

Black Point Quarry Project
Guysborough County, NS
SLR Project No.: 210.05913.00000

Species	Preferred Habitat	Life History Strategies
Atlantic Cod (<i>Gadus morhua</i>)	<p>From inshore regions to shelf break</p> <p>From surface to depths of 600 m → usually 150-200m</p> <p>Prefers temperatures between 3-8 deg C</p> <p>A variety of habitats</p>	<p>Spawns from March to December → winter and beginning of spring</p> <p>Spawning sites are in offshore water, at or near the bottom, 50-200m depth and 0-12 deg C</p> <p>Migrate between spawning, feeding and overwintering areas, usually within 200 km</p>
Atlantic Haddock (<i>Melanogrammus aeglefinus</i>)	<p>From inshore regions to shelf break</p> <p>Found in depths 10 – 450 m, usually 10-200 m → adults 80-200m</p> <p>Prefers temperatures between 4-10 deg C</p> <p>A variety of habitat, juveniles have higher survival rates when they settle on sand or gravel bottoms</p>	<p>Occasional year-round spawning activity</p> <p>Generally spawns in water less than 91 m → 50 -150 m depth</p>
Thorny Skate (<i>Amblyraja radiata</i>)	<p>Cool water fish – temperatures ranging from 50 deg F to near the freezing point of salt water</p> <p>Prefers water deeper than 18 m – majority between 65 m and 90 m likely due to the availability of food source</p> <p>Lives on the bottom partially buried in sand or mud</p>	<p>“Lay large eggs with blackish –sea green leathery shells, roughly oblong in outline, with a hollow tendril at each corner by which they become fastened to seaweeds or other objects”</p> <p>Egg cases can range from 3-3 ¼ inches in length → flat on one side and convex on the other</p> <p>Spawn throughout the year – incubation can last several months up to a year or more</p>
Winter Skate (<i>Leucoraja ocellata</i>)	<p>Depths from 45m to 65 m are preferred but can be found as shallow as 3-7m along banks and sandy beaches</p>	<p>Rock crab and squid are favoured prey</p> <p>“Lay large eggs with blackish</p>

	<p>Can be found on the icy bottom along the banks and shallower in the Southern portion of the Gulf of St. Lawrence – temperatures as high as 16 deg C or more</p> <p>–sea green leathery shells, roughly oblong in outline, with a hollow tendril at each corner by which they become fastened to seaweeds or other objects”</p> <p>“Off the Atlantic coast of Nova Scotia this skate deposits its eggs from summer into autumn”</p> <p>Egg cases can range from 2 ½ to 2 ¾ inches by 1 ¾ inches</p>	
<p>Sand Lance (<i>Ammodytes americanus</i>)</p> <p>(Auster and Stewart 1986)</p>	<p>Occur in estuarine, open coastal, and offshore habitats over sand substrates → schools during the day that increase in size as water depth increases → will bury themselves partly or fully in the sand for escape and rest → need relatively higher velocity bottom currents to keep interstitial water oxygenated</p> <p>Larvae common at the mouth of major estuaries but are commonly found right out to the edge of the continental shelf</p> <p>Most abundant between 3-6 deg C, as low as 0 deg C in bottom waters</p>	<p>Mature in 1-2 years</p> <p>Spawning occurs November to March → mainly inshore</p> <p>Eggs deposited on/in sand or gravel over a wide area</p> <p>Larvae 3-40 mm from hatching through planktonic stage to semidemersal stage where they start to exhibit schooling tendencies and burrow into the sand</p> <p>Sand Lance dominated by 1- to 2-year-old fish but can live to 9 years of age.</p>
<p>Cunner (<i>Tautoglabrus adspersus</i>)</p> <p>(Auster 1989)</p>	<p>Shallow inshore waters → on or near bottom</p> <p>Congregate around wharves, wrecks and seaweed</p>	<p>Spawning June – August</p> <p>Hibernates during the winter months under rocks</p> <p>Will return to home ranges when displaced</p>
<p>Shorthorn Sculpin (<i>Myoxocephalus scorpius</i>)</p>	<p>In shoal waters near bays and ledges → variety of substrates → prefers to hug the bottom closely</p> <p>Depths of 18-37 m → 55-60 deg F</p>	<p>Spawning November to February, main egg production in December</p> <p>Eggs stick together and sink and may be deposited in a variety of places</p>

		By May-June at lengths 22-25 mm they go from drifting near the surface to living near the bottom
<p>Atlantic Herring (<i>Clupea harengus</i>)</p> <p>(Gromack 2010)</p>	<p>Inhabit open sea and offshore banks</p> <p>Adults migrate hundreds of miles throughout their life</p> <p>During winter migrations they can form massive schools</p> <p>“Herring that spawn off the southwest coast of Nova Scotia near Yarmouth winter in Chedabucto Bay in northern Nova Scotia, a sea migration of over 500 kms” (http://www.gma.org/herring/biology/life_cycle/default.asp)</p>	<p>Travel from spawning sites (coastal, offshore, offshore banks) to feeding grounds in a migratory cycle → dependent on season and life history stage → spawning times late summer and early fall</p> <p>Eggs sink to the bottom to form dense carpets of eggs and hatch into larvae in 7-10 days (dependent on water temp) → larvae drift on ocean currents and eddies (7-29mm)</p> <p>Young juveniles (~40mm) are abundant in inshore waters through spring and summer → schools of juveniles will enter shallow bays and inlets → late summer and fall they move offshore to winter near the bottom (also avoid the adults going to the spawning grounds)</p> <p>Maturity reached at about 3-4 years and 23-26 cm → migrate to feed, spawn and over-winter</p>
<p>Atlantic Mackerel (<i>Scomber scombrus</i>)</p> <p>(Gromack 2010)</p>	<p>Gather in dense schools of thousands of fish during the daytime (14-18 m) and night time (as deep as 27-46 m)</p> <p>Prefer the open sea, young can enter estuaries and harbours looking for food but never fresh water → not</p>	<p>Spawn in spring and early summer (June for outer Nova Scotia) anywhere along the coast from Cape Hatteras to the southern side of the Gulf of St. Lawrence → release eggs wherever, no particular</p>

	<p>dependent upon being near the coast nor the bottom → usually found from the inner half to outer part of the continental shelf but not usually beyond the upper part of the shelf</p> <p>Range from surface to as deep as 100 fathoms (183 m) → spring to autumn common in 25-30 fathoms (46-55 m) and shallower</p> <p>Temperatures of 7-20 deg C</p>	<p>substrate → drift with the currents</p> <p>Newly hatched larvae 3.1-3.3 mm, resemble parents at 50 mm</p> <p>Migrate from the coast to deeper waters by the end of December and return in the spring and early summer</p>
<p>Atlantic Bluefin Tuna (<i>Thunnus thynnus</i>) (DFO 2013)</p>	<p>Open water fish but sticks to the continental shelf during the warm seasons due to prey concentration being higher → 50-54 deg F lower temp range favoured, when sea temps start to drop in autumn the schools will migrate to warmer waters</p> <p>Travel in small schools of 6 – 40 fish sometimes much larger schools → schools are made up of fish of approximately the same age → very large fish can be solitary</p> <p>Congregate at or near the surface → lower depths vary depending on temperature and prey</p>	<p>Prey on smaller schooling fish</p> <p>Will chase prey into small harbours and bays along the outer coasts of Nova Scotia, including Bras D'or lake</p> <p>Migrate up from Jamaica and the Gulf of Mexico starting in May and are reported in the Gulf of St. Lawrence in June-July</p> <p>Adults spawn in the Gulf of Mexico (mainly the northern portion) in early spring (April and May) and then migrate up the Western Atlantic (east coasts of the US and Canada) for their fall feeding season</p> <p>Juvenile tuna tend to stick to the eastern coast of the US with depths ranging from surface up to 250 m → mainly between surface and 50m m from July to Sept, and deepening in range gradually from Oct to April and back up again from May to June</p>

Species	Preferred Habitat	Life History Strategies
<p>American Lobster (<i>Homarus americanus</i>)</p> <p>(Mackenzie and Moring 1985)</p>	<p>Relatively low concentrations live along the outer edge of the Nova Scotia shelf</p> <p>Two types: inshore and offshore</p> <p>Offshore lobsters migrate between the outer Continental Shelf and shallower Continental Shelf seeking the optimum temperatures for growth and mating → migrations are triggered by water temperature changes, seek temps of 8-14 deg C → In spring they move to shallower water and return to the outer shelf starting in late summer through to Nov-Dec → use mud or clay substrates to make bowl shaped depressions for shelter</p> <p>Inshore lobsters don't migrate and have a limited home range → will move to deeper water during a storm → subject to winter temperatures → prefer sand with overlying boulder substrates</p> <p>Canadian east coast lobsters will move to water 15-18 m deep in the winter, and 7-9 m deep in the summer</p>	<p>Spawning lobsters pair for about 2 weeks after the females have molted → eggs are extruded 11-13 months after mating and attach to the females bodies for 9-11 months → eggs hatch from May to October depending on water temperature (starts at 15 deg C and peaks at 20 deg C) → females release larvae at night</p> <p>Four larval stages where they are planktonic and positively photosensitive from May to October → part way through stage four they turn negatively photosensitive and retreat to the bottom and burrow into the substrate → molt into juveniles while in their burrows</p> <p>Juveniles (<35 mm) rarely leave their burrows or shelters → 35-40 mm they start to venture outside → 45 mm they start to forage</p> <p>Juveniles and adults travel less than 300 m from their shelters</p> <p>Offshore lobsters molt more often than inshore lobsters → molting lobsters are more susceptible to low salinities</p> <p>Juveniles and adults are predators and catch live prey mostly → prefer rock crabs but will eat sea urchins, mussels, and sea stars</p> <p>Adults are preyed upon by many species including: Atlantic Cod, Skates, Cunners, and Haddock</p>
Rock Crab (<i>Cancer irroratus</i>)	Inhabit near shore Atlantic regions from southern Labrador to Miami,	Mating occurs after females have moulted → can produce 4000-

(<p>Florida → shallow waters in bays on sandy or muddy bottoms → depths from 0-575m, Canada's east coast generally between 5-20m</p>	<p>330,000 eggs → extruded mid-late autumn through to spring-early summer</p> <p>Larvae are planktonic for six stages of moulting before settling to the bottom → settle inshore on gravel or cobble substrates for juvenile stage</p> <p>Juvenile and adult diets include sea scallops, green sea urchin, sand shrimp, mussels, snails brittlestar and polychaete → Larger adults will prey on small lobsters</p>
<p>Snow Crab (<i>Chionoecetes opilio</i>)</p> <p>(DFO 2013)</p>	<p>Predators are: skates (primarily thorny skate), cod, seal, halibut, and the American plaice → smaller and soft-shell crabs are highly vulnerable</p> <p>Prefer a temperature range of 3-4 deg C on muddy or sandy bottoms ranging from 50-600 m</p> <p>"mostly found in the estuary and the Gulf of St. Lawrence, around Cape Breton Island, on the Scotian Shelf..."</p>	<p>Females are much smaller than males → only males are allowed to be harvested</p> <p>Mating pairs migrate to shallow waters in the spring → eggs are fertilized before being released → females carry the eggs under their abdomen for 1-2 years (water temperature dependant) before they hatch</p> <p>Eggs hatch in the spring (April to late May) and are planktonic larvae for 3-5 months until settling to the bottom for their juvenile stage</p> <p>Males go through: juvenile (cannot reproduce), adolescent (reproductive organs work but no enlarged claws), and adult (enlarged claws) → moult every year until they develop enlarged claws (8-13 moults)</p> <p>Females go through: immature (narrow abdomen and no detectable ovaries), prepubescent</p>

		(ovaries begin to develop), adult (broader abdomen and ability to reproduce)→ become sexually mature between 8-10 moults
<p>Northern Shrimp (<i>Pandalus borealis</i>)</p> <p>(DFO 2014)</p>	<p>Prefers soft muddy bottoms between 150-600m deep</p> <p>Prefers water temperature of 2-6 deg C</p> <p>Migrate vertically and horizontally in the water column → egg-bearing females will migrate to shallower water and congregate → will migrate at night from the bottom through the water column in search of food (krill and copepods) → feed on the bottom during the day on annelids, small crustacean and detritus</p>	<p>Mating occurs in late summer-fall → eggs remain attached to the females until the following spring (7-8 months)→ hatch in April-May and larvae are planktonic for a few months before spending more time near the bottom</p> <p>Reach male sexual maturity at 2-3 years → transition to females over the winter when 4-5 years→ mating takes place the following fall</p>
<p>Sea Scallop (<i>Placopecten magellanicus</i>)</p> <p>(Mullen et al. 1986)</p>	<p>Occupy coastal waters rarely deeper than 110 m</p> <p>Do not compete well with other molluscs for food or space</p> <p>Young prefer shell fragments and other animals for settling due to the inability to survive on shifting sand bottoms and provides protection from predators</p> <p>Predators include: rock crab, adult and juvenile lobster, Atlantic cod, and sculpins, among others</p>	<p>Sea scallop eggs and larvae are planktonic → eggs hatch 30-40 hours after fertilization (at 12-18 deg C)→ larvae remain planktonic for over a month and may be transported by currents out of their spawning area before spatfall → spat crawl around on the bottom until they can find something hard to attach to → relatively active until about 8cm long and can swim away when under threat (predators or dredging) → adults >10mm detach from the epibenthic structures and settle to the bottom → adult scallops (> 9 cm) do not migrate</p> <p>Spawning occurs in Newfoundland at temps between 4-16 deg C → a rapid drop in temperature may trigger spawning</p> <p>Commercially viable when reach</p>

		fifth or sixth year → the success/failure of a specific year class (affected by temperature and spawning success) can in turn have an effect on the commercial catch 5-6 years later
Green Sea Urchin (<i>Lytechinus variegates</i>) (DFO 2000-06)	<p>Prefer shallow waters (<10 m) with rocky substrates (but will tolerate any substrate) → avoid areas of extreme wave action → can be found as deep as 1000 m</p> <p>“Found in highest concentration in feeding fronts bordering the deep edge of kelp beds”</p> <p>Thought to migrate seasonally</p>	<p>Crawl along the ocean floor feeding on fine algae, kelp and seaweeds</p> <p>Spawns in late winter/early spring → larvae planktonic for 8-12 weeks and then settle to the bottom → growth dependent on temperature and food supply taking anywhere from 5-15 years to reach commercial size of 50 mm</p>

¹ denotes Canadian Council of Ministers for the Environment (CCME) Canadian Environmental Quality Guidelines - Sediment Quality Guidelines, revised 2002.

² denotes Canadian Council of Ministers for the Environment (CCME) Canadian Environmental Quality Guidelines - Soil Quality Guidelines, revised 2008.

³ Total PAH calculation based on the sum of 16 PAH compounds (acenaphthene, acenaphthylene, anthracene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluorene, fluoranthene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene, and pyrene) as per guidance from Environment Canada, 2009.

⁴ denotes Index of Additive Cancer Risk (IACR) = ([Benzo(a)anthracene]/0.33mg/kg) + ([Chrysene]/2.1mg/kg) + ([Benzo(b+j)fluoranthene]/0.16mg/kg) + ([Benzo(k)fluoranthene]/0.034) + ([Benzo(a)pyrene]/0.37mg/kg) + ([Indeno(1,2,3-c,d)pyrene]/2.7mg/kg) + ([Dibenz(a,h)anthracene]/0.23mg/kg) + ([Benzo(g,h,i)perylene]/6.8mg/kg).

⁵ denotes Total Potency Equivalent (TPE) SQG based on an incremental lifetime cancer risk (ILCR) of 1 in 100,000 (10⁻⁵).

⁶ "NA" denotes the Benzo(a)pyrene TPE has not been multiplied by an uncertainty factor (UF) of 3 as results from the lab indicate there is no evidence of creosote in the sample.

NOTE: All results below the laboratory detection limit were divided by 2 prior to further calculations.

OC Pesticides and PCBs in Soil

DATE SAMPLED: Sep 01, 2010

DATE RECEIVED: Sep 02, 2010

DATE REPORTED: Sep 15, 2010

SAMPLE TYPE: Soil

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard

1971606 Results are based on the dry weight of the soil.
Due to the high moisture content the sample was air dried prior to extraction.

1971621-1971639 Results are based on the dry weight of the soil.
Due to the high moisture content the sample was air dried prior to extraction.
Sample was diluted and Reporting Detection Limit raised due to chromatographic interference.

1. Introduction: Project Description Summary

The Black Point Quarry Project is an initiative of Erdene Resource Development Corp (referred herein to as “Erdene”) located in Dartmouth, Nova Scotia.

AMEC Earth & Environmental Ltd. (a division of AMEC Americas Ltd.), a sub-contractor of Erdene, contracted MAPS to undertake an MEKS on this project.

Erdene proposed the establishment of a new quarry on a property it acquired on the shore of Chedabucto Bay (see Appendix 1). The proposed Black Point Quarry is located on a 280 hectare parcel of land approximately 10 km west of the town of Canso, Guysborough County. The southern boundary of the project area runs along a high-voltage power transmission line, and a new access road of about 990 metres is planned from there southward to Provincial Highway 16 (Fig.2). This property contains a large tonnage of high-quality granite which Erdene seeks to extract.

Situated on sheltered ice-free tidal water, the location offers direct access to international shipping lanes, thus facilitating efficient transportation of the product to US and Caribbean markets via bulk carrier vessels.

Fig. 1: Black Point Quarry Project location

According to Erdene’s calculations “the anticipated annual production rate will exceed 1.0 million tonnes with an anticipated peak production rate of 6.5 million tonnes per year. The anticipated operating schedule is 15 hrs/day, 7 days/week, on a year-round basis and weather permitting. Estimated rock reserves are in the order of 250 million

tonnes. Quarry operations are expected to take place over a period of approximately 50 years, depending on demand for aggregate” (Erdene, Project Information, Appendix 1). The Black Point Quarry project is expected to involve open-pit mining, the construction of facilities to process granite into aggregate (involving drilling, blasting, crushing/ processing and stockpiling). It will also include the construction and operation of a marine shipping terminal on Chedabucto Bay, adjacent to the quarry, where processed aggregate will be off-loaded onto Panamax-sized ships of up to 70,000 tonnes (Erdene, Project Information, Appendix 1).

The project study area as defined by the proponent covers a parcel of land on the Chedabucto Bay, about 10 kilometres west of Canso. It encompasses the quarry site and its immediate surroundings only (Fig.2) with no surrounding buffer zone, and does not include the access road from their study area’s southern boundary to Highway 16. It is herein therefore referred to as the ‘project area’ in order to distinguish it from the study area of this MEKS.

The nature of this development has triggered both Federal and Provincial environmental protection legislation. Part of this legislation requires the project proponent to prepare an Environmental Impact Statement (EIS).

Apart from potential impacts on the natural environment, the EIS is also meant to evaluate potential effects on the social environment. This includes archaeological and heritage resources, the current use of traditional lands and resources by Aboriginal people, and possible impacts on the cultural integrity of the surrounding Aboriginal communities.

MAPS was mandated to conduct the research necessary to evaluate such potential impacts of the Projects on the Aboriginal community through this MEKS.

Fig 3: Project Area Overlay on Aerial View

2. Methodology

2.1. Purpose, Scope and Ethics of this MEKS

Mi'kmaw Ecological Knowledge (MEK) has been defined in the Mi'kmaq Ecological Knowledge Protocol (Protocol) as "...the collection and adaptation of knowledge that Mi'kmaq people have with all components of the natural environment and the interrelationships between all life forms from a unique historical, cultural and spiritual level." The Protocol was ratified by the Assembly of Nova Scotia Mi'kmaq Chiefs on November 22, 2007 and outlines specific guidelines and conditions on the development of a MEKS in the province.

The purpose of a MEKS is to identify and report any ecological concerns regarding the Project's impact on Mi'kmaq use of land, resources and special places within the Project Study Area.

MAPS' methodological approach includes the adherence to the Mi'kmaq Ecological Study Protocol, ratified in 2007 by the Assembly of Nova Scotia Mi'kmaw Chiefs (Appendix 2). Accordingly, this research initiative and its methodological approach were communicated to the Mi'kmaw Ethics Watch Committee in 2010 whose mandate is to ensure research activities with the Nova Scotia Mi'kmaw community comply with the Mi'kmaq Research Ethics Protocol of 1999.

MAPS informed the Union of Nova Scotia Indians as well as the Confederacy of Mainland Mi'kmaw and the Native Council of its intention to carry out this MEKS. MAPS undertook to publicize an announcement and description of the research initiative through its website, and information bulletin to all Nova Scotia First Nation Councils, and an article in the Mi'kmaq-Maliseet Nations News (Appendix 3) asking for public input.

A community meeting was held by MAPS in Paqtnkek, the Mi'kmaw community closest to the Project Site.

To insure the non-Aboriginal community was also informed, a similar article was published in the Guysborough Journal and the Guysborough Chamber of Commerce was notified.

2.2. Research Methodology

The research involved in the preparation of this MEKS is based on several components:

- An assessment of the study area's archaeological resources or potential based on existing reports;
- A survey of archival, published and unpublished material relating to historic Mi'kmaw land uses and occupancy in the study area;
- A two-season ground survey of local plant resources significant to the Mi'kmaw community;
- Community-based research in the surrounding Mi'kmaw communities of Paqtnkek, Millbrook and Chapel Island with Mi'kmaw knowledgeable about the Study Area, its resources and recent and current Mi'kmaw land uses.

A detailed interview guide was developed specifically for this study in order to insure a consistent approach in the interviewing and recording of data by the three interviewers in the above-mentioned communities.

2.3. Limitations

- Very little archaeological work has been carried out so far in Guysborough County, and particularly along the Chedabucto coast. A scarcity of pre-contact archaeological evidence in this region does therefore not allow the conclusion of low Aboriginal use and occupancy during that period;
- The Centralization policy in Nova Scotia during the first half of the 20th century disrupted traditional patterns of Mi'kmaw land use and occupancy;

- Land and resource use data, both those stemming from MAPS' general data base as well as those collected for this study specifically, are based on interviews of samples of Mi'kmaw Elders and active land users. The land use data represented here therefore cannot be comprehensive. It serves as positive proof of Mi'kmaw land and resource use in the study region, but does not imply that locations or resources not mentioned here are indeed not utilized by Mi'kmaw.

2.4. Study Area

Mi'kmaw land use patterns are naturally wide-ranging in response to the seasonally and spatially fluctuating resources they depend on. With respect to historic and contemporary Mi'kmaw land use, the Black Point Quarry Project Area, can in the context of this MEKS, not be considered in isolation, but as an integral part of the wider Chedabucto shore resource area of the Mi'kmaw community.

The Study Area therefore stretches from Halfway Cove to Durells Island and Canso (Fig. 4) and includes the shore, the adjacent strip of land of about 5 kilometres in width, and near-shore waters of the Chedabucto Bay. Information outside this study may also be considered when it serves to illustrate wider-ranging patterns of Mi'kmaw land use.

Fig 4: Study and Project Areas

3. Section I: THE SETTING

3.1. Biophysical Environment

3.1.1. Geology

From the Chedabucto Bay shoreline and the base of the low-lying Fogherty Head (with its Black Point peninsula) at the northern end of the project area the terrain rises sharply to the plateau where the quarry site is situated (Figs.5-7).

Fig 5: Fogherty Head and Fogherty Lake, Easterly View from Chedabucto Bay

While Figure 5 offers a simulated view of the natural landscape based on satellite imagery, figures 6 and 7 illustrate the area's relief more clearly through contour lines and a LIDAR image modelling the surface structure underneath the vegetation cover. The hill featuring the resource to be quarried has an elevation of about 103 m above mean sea level².

² AECOM 2011:7

Fig 6: Project area with contour lines³

Fig 7: Relief Model of the Northern Portion of the Project Area⁴

³ Project area inset adapted from AECOM 2011:7

⁴ LIDAR image, source AECOM 2011:14

While the bedrock geology of the Fogherty Head consists of schist, medium-grade metamorphic rocks of the Goldenville (COMg) and Halifax (COMh) formations, that of the remainder of the project area features granite (M-LDmbmg) with very little overburden – the resource to be mined. The wider study area is made up of undulating bands and regions with primarily the same three geological features (Fig.8).

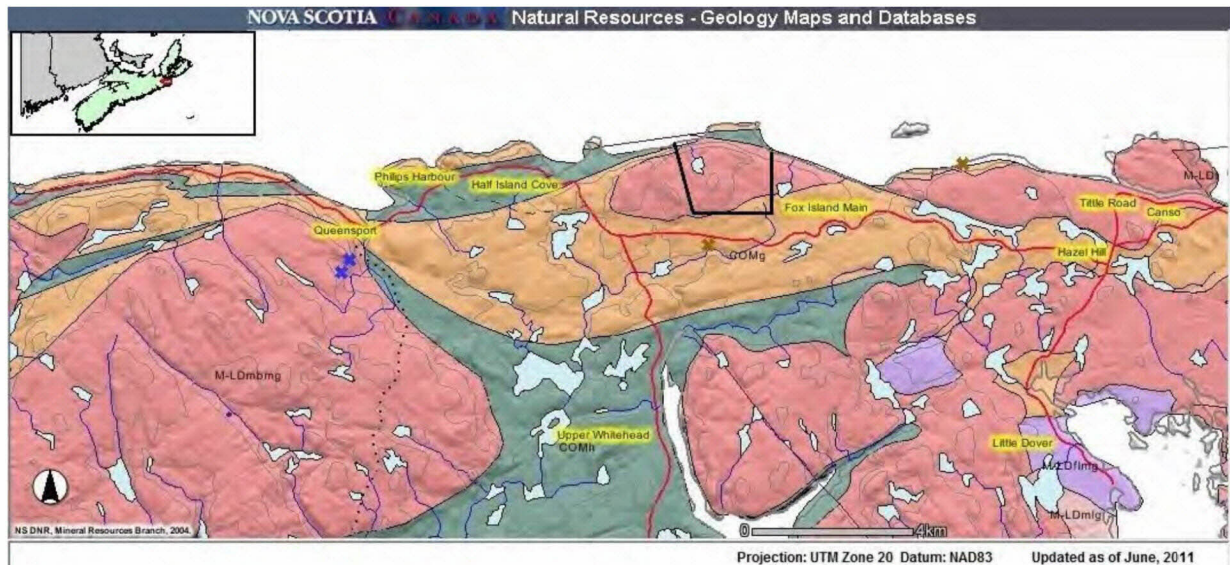

Fig. 8: Bedrock Geology of the Project and Study Areas⁵

The project area consists mostly of well drained, coarse textured soil, in the northern and western portion primarily on hilly terrain (WCKK), and in the central and eastern portion on hummocky terrain (WCHO). The central portion also contains a flat area of poorly drained, medium textured soil (WTLD), a bog, to the east of Fogherty Lake. A similar soil pattern is repeated in the Canso area. The region south of the project area is mostly hummocky, imperfectly drained and medium textured (IMHO), while to the west we mainly find well drained, medium to fine textured soil on hills and drumlins (WMKK, WFDM).

The particular soil and drainage pattern (Fig. 9), in combination with the underlying bedrock geology, produce a variety of ecological land classes which, again, allow or foster particular habitats.

The wider Study Area is located within what is called the Canso Barrens, a region generally characterized by exposed granite knolls and erratic and thin soil layers.

⁵

Adapted from NS DNR online map 'Geology Maps and Databases' (<http://gis4.natr.gov.ns.ca/website/nsgeomap/viewer.htm>)

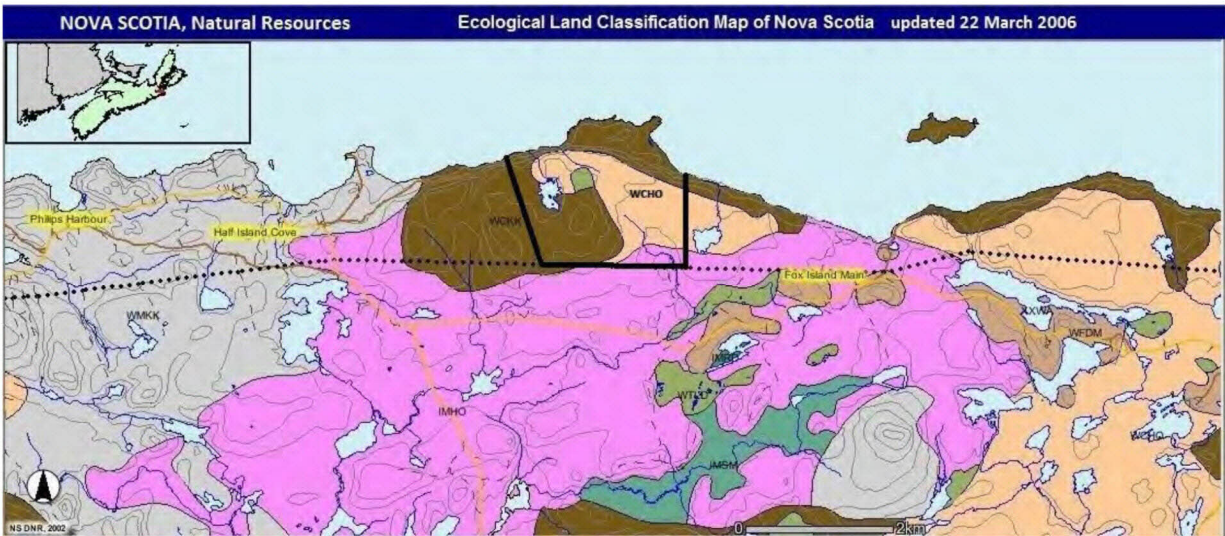

Fig 9: Ecological Land Classification⁶

3.1.2. Vegetation, Habitats and Wildlife Resources

These surface conditions produce distinct vegetation covers and habitats. Most of the plateau is blanketed with a patchwork of lichen (*Cladonia rangiferina* and others) and shrub dominated tundra-like ground cover interspersed with stands of open coniferous forest. The latter consists mainly of black spruce (*Picea mariana*), white spruce (*Picea glauca*), balsam fir (*Abies balsamea*), white birch (*Betula papyrifera*) and tamarack (*Larix laricina*). More densely and mixed forested habitats are sheltered slopes, stream channels and low-lying areas in general, and particularly the Fogherty Head area, where some mature balsam firs are found (Fig. 10).

Similar vegetation patterns are found to the south of the Project Area and, with varying proportions of lichen barrens to woodlands, throughout the Study Area.

The vegetation surrounding Fogherty Lake, for example, features black spruce and tamarack as the predominant tree species, shrubs and herbaceous plants such as leatherleaf (*Chaemodaphne calyculata*), sheep laurel (*Kalmia angustifolia*), chokeberry (*Photinia pyrifolia*), possum-haw viburnum (*Viburnum nudum*), rhodora (*Rhododendron canadense*), Labrador tea (*Ledum groenlandicum*), and bunchberry (*Comus canadensis*)⁷.

⁶ Adapted from online NS DNR online map 'Ecological Land Classification', (<http://gis4.natr.gov.ns.ca/website/nscmap/viewer.htm>)

⁷ AECOM 2011:28

Fig 10: Vegetation Cover (Satellite Image), Project Area

Other habitats, throughout the Study Area, include coastal beaches, cliffs and barren headlands.

An initial vegetation survey conducted by AECOM reports the occurrence of one species of concern, *Peltigera leucophlebia*, a lichen commonly called Ruffled Freckled Pelt, in the eastern portion of the Project Area⁸. This species is listed as vulnerable by the Nova Scotia Department of Natural Resources. A second lichen also found in this area, *Ramalina thrausta* or Angel's Hair, was categorized as "uncommon"⁹.

The entire Study Area, including the Project Area (Fig. 11), is interspersed with a variety of wetlands types from bogs and fens to streams and lakes. Important features in this landscape, they act as surface water reservoirs and filters, and provide habitat to a large variety of distinct aquatic, semi-aquatic, riparian and terrestrial plant and wildlife species.

Within the Project Area and along the access road leading to Highway 16, 26 wetlands were identified and briefly described by AECOM¹⁰.

⁸ Ibid:31
⁹ Ibid:31
¹⁰ Ibid:32-33

Several areas with habitats significant enough to be declared protected by the Province are located in the vicinity of the Project Area, and within the Study Area of this MEKS. Both Half Island and Lower Half Island coves as well as Fox Island Main (Indian Cove) feature protected beaches. The Bonnet Lake Barrens and Canso Coastal Barrens wilderness areas encompass large areas located about 7 km southwest and 2 km south and southeast, respectively, of the Project Area. In addition, Third Lake Provincial Park is located about 5 km southwest of the Project Area and consists of several parcels surrounding Coeeycoff Lake (Fig. 12).

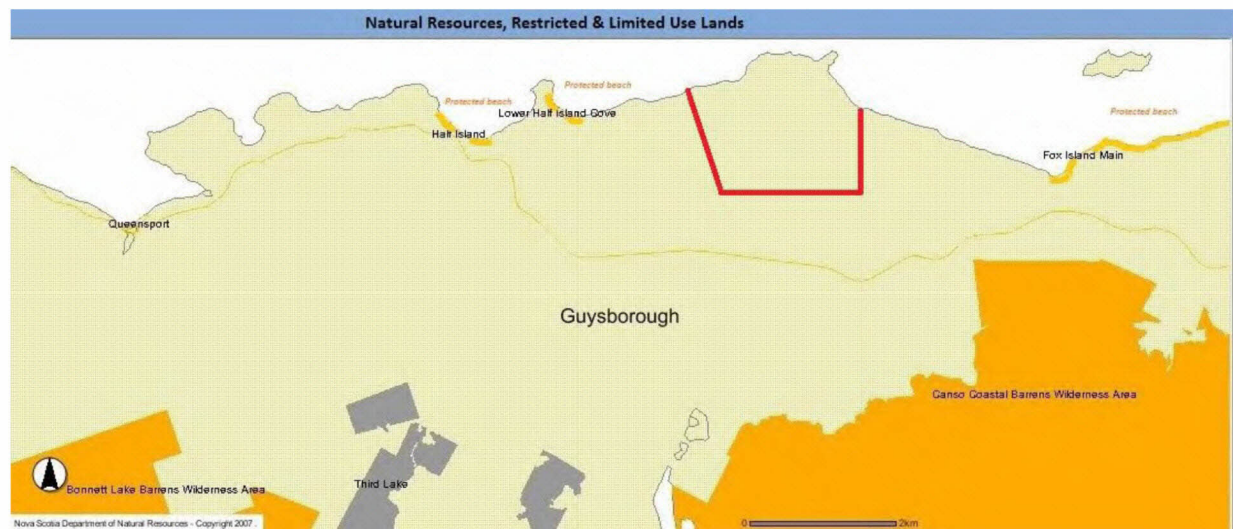

Fig. 12: Restricted and Limited Use Areas¹²

Wildlife species present in the study and project areas cover the spectrum of species found in most regions of Nova Scotia.

Among mammals these include Whitetail Deer (*Odocoileus virginianus*), Black Bear (*Ursus americanus*), Eastern Coyote (*Canis latrans thammers*), Red Fox (*Vulpes vulpes*), Bobcat (*Lynx rufus*), Beaver (*Castor canadensis*), Muskrat (*Ontatra zibethicus*), Porcupine (*Erethizon dorsatum*), Snowshoe Hare (*Lepus Americana*), Red Squirrel (*Tamiasciurus hudsonius*), Raccoon (*Procyon lotor*), Otter (*Lontra canadensis*), Short-tailed Weasel (*Mustela erminia*), Mink (*Neovison vison*) and small rodents such as voles, mice and shrews.

¹² Adapted from NS DNR online map 'Restricted & Limited Use Areas' (<http://gis4.natr.gov.ns.ca/website/r1ul2b07/viewer.htm>)

While not confirmed in AECOM's survey, Mi'kmaw report the presence of Mainland Moose (*Alces alces americana*), a threatened species .

Marine mammals reported present along the Study Area's shore are the Minke Whale (*Balaenoptera acutorostrata*) and Grey Seal (*Halichoerus grypus*)¹³.

A bird survey in the Project Area, commissioned by AECOM, reported the following 11 species that are either classified as species of concern or known to be particularly sensitive to anthropogenic disturbances: Boreal Chickadee (*Poecile hudsonia*), Common Loon (*Gavia immer*), Gray Jay (*Perisoreus canadiensis*), Rusty Blackbird (*Euphagus carolinus*), Greater Yellowlegs (*Tringa melanoleuca*), Red-breasted Merganser (*Mergus serrator*), Semi-palmated Sandpiper (*Calidris mantilla*), Spotted Sandpiper (*Actitis macularius*), Least Sandpiper (*Calidris pusilla*), Semi-palmated Plover (*Charadrius semipalmatus*) and Great Cormorant (*Phalacrocorax carbo*). Two owl species were confirmed, the Northern Saw-whet Owl (*Aegolius acadicus*) and the Barred Owl (*Strix varia*). Even though it was not observed during this field survey, the Chedabucto Bay shoreline is known to also harbour Harlequin Ducks (*Histrionicus histrionicus*), another species of concern¹⁴.

Of the reptilian and amphibian species commonly found within Nova Scotia, the Yellow Spotted Salamander (*Ambystoma maculata*), American Toad (*Bufo Americana*), Spring Peeper (*Pseudacris crucifer*), Green Frog (*Rana clamitans*), Northern Leopard Frog (*Rana pipiens*), Bullfrog (*Rana catesbeiana*), and the Maritime Garter Snake (*Thamnophis sirtalis pallidulus*) were confirmed to be present in the Project Area. No rare or sensitive species in those categories were reported¹⁵.

From the family of dragon/damselflies (*Odonates*), however, a Spotwinged Glider (*Pantala hymenaea*), which is listed by the Province as being sensitive to anthropogenic or natural impacts, was observed to be present in the wetland area east of Fogherty Lake¹⁶.

Results of the freshwater fish and fish habitat survey as reported by AECOM are based on brief fish samplings in Fogherty Lake and three unnamed streams. One of these streams is the northern outflow of Fogherty Lake, the second a brook originating in a narrow valley in the northern portion of the Project Area and emptying into Chedabucto Bay, a third a stream in the southwestern part of the Project Area flowing through softwood stands and fens before discharging into Hendsbee Lake, and a fourth one near the western edge of the Project Area.

¹³ AECOM 2011:35

¹⁴ Ibid:34, 35

¹⁵ Ibid: 35

¹⁶ Ibid: 36

Being situated largely on a granite bedrock formation and being fed in part by surface runoff from surrounding bogs, Fogherty Lake is tea-coloured and fairly acidic, like many Nova Scotia lakes. Based on a survey employing two gillnets and four minnow traps for a total of six hours, AECOM's report reports that Fogherty Lake contains no significant fish populations due to the high acidity levels. The same conclusion was reached with respect to the streams tested¹⁷.

The near-shore underwater marine habitat along the Project Area consists mainly of cobble and rock substrate with lesser amounts of sand and silt supporting "a high diversity of both floral and faunal species"¹⁸.

Algal cover increases from sparse in deeper water up to 90% along the shore and features Black Whip Weed (*Chordaria flagelliformis*), Bladderwrack (*Fucus vesiculosus*), Sea Colander (*Agarum clathratum*), and occurrences of the invasive species Green Fleece (*Codium fragile*).

Little information is given on faunal species. The presence of several species of annelid worms (Polchaetes) and two bivalves, the Common Tortoiseshell Limpet (*Tectura testudinalis*) and the Interrupted Turbonille (*Turbonilla interrupta*), are identified. No further observations of fish, crustaceans or other mollusk species are reported in this study.

Nevertheless, it can safely be assumed that this habitat supports a variety of fish and other marine species, and serves as a nursery habitat for a number of species which then spend the remainder of their life cycles in other areas and/or deeper waters.

3.2. Surrounding Mi'kmaw Communities

The Project Area is located in the Eskikewa'kik district of Mi'kma'ki¹⁹. The closest of the current Mi'kmaw reserves are Paqtnkek on the mainland, and Chapel Island on Cape Breton Island.

However, a number of Mi'kmaw families have, until very recently, resided seasonally or year-round in the adjacent communities of Half Island Cove, Fox Island, and in Cook Cove and Dorts Cove at the western end of the Chedabucto Shore.

¹⁷ AECOM 2011:26, 28

¹⁸ Ibid:28-29

¹⁹ Mi'kma'ki (the Mi'kmaq territory) consists of seven districts encompassing all of Nova Scotia and Prince Edward Island, plus parts of New Brunswick, Quebec and Newfoundland

4. Section II: HISTORIC MI'KMAW USE & OCCUPATION

4.1. Pre-Contact Mi'kmaw Land Use and Occupancy

Nova Scotia has been progressively occupied by the ancestors of the Mi'kmaw as the regional glaciers of the last ice age retreated. This is evidenced by the hitherto earliest finds at Debert dating back to about 11,500 BP²⁰ and being classified as belonging to the Paleo Indian or Sa'qewe`k L`nuk Period²¹.

A substantial cooling during the Younger Dryas period about 10,800-10,200 BP caused again minor glaciations with ice sheets covering again what is now Guysborough, Pictou, Antigonish counties, plus the Cape Breton highlands²².

At present, the archaeological record for Guysborough County, and the Study Area in particular, is very sparse which is primarily a reflection of the relative lack of archaeological research that has been carried out in this region so far²³. The vast majority of archaeological discoveries in Nova Scotia have been incidental rather than the result of targeted archaeological surveys. More often than not they have been made in the context of some sort of development – residential, industrial or infrastructural construction or agricultural activities. The Study Area has not seen much of any of these activities. Much of the existing archaeological material relating to Mi'kmaw and their ancestors in this region consists of sporadic surface finds.

Reviews of the existing literature and the Provincial archaeological database nevertheless identify some archaeological sites or finds in Guysborough County. Not surprisingly, the majority cluster along the St. Marys and Country Harbour rivers, both important travel routes between the Eastern Shore and the Northumberland Strait/ St. George's Bay coast. Others are located to the west and east of the Study Area, that is on the lower Salmon River and Cooks Cove, and at the east end of Canso and on Grassy Island²⁴.

Two significant finds are a cache of projectile points on Grassy Island, dated to about 500 AD²⁵.

In light of the aforesaid it is obvious that the lack of archaeological evidence in the Study Area cannot be construed as proof of a lack of Mi'kmaw occupancy²⁶.

²⁰ Robinson 2011

²⁴ Lewis 2011 (appendix 4); Ferguson 2012

²⁵ Ferguson 2011

The three most significant factors for determining the archeological potential of a site or area are: food resources, access and suitability for habitation.

In general Mi'kmaw land use and occupancy involved semi-permanent and permanent settlement at resource-rich locations. Summer villages were usually situated at a navigable body of water. Preferred locations were the mouths of rivers with significant spawning runs of salmon, eel and other fish species. Such sites provided ready access to freshwater and marine resources, plus a waterway into the interior.

The richness in resources of both the land and sea along the Chedabucto shore (including the Study Area) and the ease of access made this an attractive region to the Mi'kmaw and their ancestors.

Early written records document that the first European explorers and settlers found the Chedabucto bay and coast extremely rich in fishery resources and established in the 16th century Grassy Islands Fort as a base in the centre of this rich fishing ground. During the 16th and 17th centuries the French controlled the commercial fishery in this area, to be taken over by the British during the first half of the 18th century. While cod was the Europeans' primary commercial fishery interest, salmon and eel also figured prominently in the Mi'kmaw economy.

The Nova Scotia coast was also rich in marine mammals such as walrus, grey seals, and minke whales. These were also hunted by Mi'kmaw for food, skins and other raw materials. This is evidenced, for example, by several ancient Mi'kmaw place names along the southern shore of Prince Edward Island that refer to seasonal walrus colonies and walrus hunting²⁶. By the time Europeans entered the scene, it appears that regional walrus number had been declining for some time due to climatic changes and the associated seas level rise, but the additional hunting pressure by the newcomers for their ivory and oil accelerated their disappearance. The last populations of walrus in Nova Scotia were reported to exist on Sable Island in the late 1700s²⁸.

Regional pre-contact resource also included sea birds, among them the Great Auk. With the arrival of Europeans, Great Aulks were hunted extensively, their feathers used in bedding, their meat and eggs for fish bait and food. Eventually, this bird met the same fate as the walrus, aulks disappeared from Nova Scotia, and soon thereafter became extinct.

Terrestrial wildlife resources during the pre-contact included woodland caribou and mainland moose, in addition to the other species we find in the Study Area today.

²⁶ Lewis 2011 (appendix 4); Sheldon 2000:12

²⁷ Weiler 2008:17

²⁸ Gilpin 1869:126-127, COSEWIC 2006:12

Moose as well as the caribou herds roaming the open inland areas, and in particular the barrens, would have been able to support relatively large groups during the winter months.

In general, Mi'kmaw place names are geographically descriptive or refer directly or indirectly to resource uses. It is generally accepted that such place names are very stable and long-lived, and their origins pre-date the arrival of Europeans. Indeed most of the Mi'kmaw place names known to date were recorded by missionaries during the early contact period.

This is also the case with the names of some locations in the study area thereby attesting to Mi'kmaw occupancy and land use since time immemorial.

Mi'kmaw Place Names in Guysborough County ²⁹.

Guysborough County – *Esigeoagig* (*Eskikewa'kik*³⁰) - skin dressing place

Chedabucto – *Sedabuktook* - the deep extending harbour, or running far back³¹

Cooks Cove – *Notogtetoalneg* - small Indian village

Halfway Cove – *Oetonitjitig* (*Wetuni'ji'jk*³²) - at the small opening³³

Philips Harbour – *Pilipgomimg* - Pilip's place, where Pilip was doing something

Half Island Cove – *Aoaganeg* - portage

Black Point – *Magteoatgeg* - black head

Indian Cove – *Elnoeigomi* - Indian cove

Fox Island – *Sebelogwokun* - where skins are stretched

Fox Island Cove – *Nasonigetig* - rushy

Durells Island – *Siplogagneg* - narrow passage³⁴

Canso – *Gamsog* – rock on the other side

This district's Mi'kmaw name, *Eskikewa'kik*, translates to 'skin-dressing country' (or 'skin dressers place') which may refer to the region's ample supply of sea mammal and possibly caribou skins during this period as its environment does not seem to have been exceptionally productive habitat for furbearers such as beaver, muskrat, otter, marten, mink, weasel, fox, etc.

The fact that the Mi'kmaw name for Fox Island, *Sebelogwokun*, identifies this small island as a 'place where skins are stretched' supports this interpretation. If Fox Island was used customarily by Mi'kmaw harvesters for stretching (and drying) a significant number of skins they may have stemmed from a resource that can be harvested locally

³⁴ Preliminary translation by B. Francis, p.c. Sept 2012

in considerable numbers at certain times of the year – as marine mammals were. And since the populations of these marine mammals appear to have been in decline at the time of, or following, the arrival of Europeans in the area, one can safely conclude that the origin of the name lies in the pre-contact era.

Moving along the shore of *Sedabuktok*, the ‘deep and extending harbour’ or Chedabucto, from west to east, Cooks Cove or *Notogtetoalneg* was named so because of the ‘small Indian village’ that was located there.

Oetonitjitig (*Wetuni’ji’jk*) refers to ‘small opening’, the bay at Halfway Cove which represents the entry to a travel route into the interior that eventually cuts across to Tor Bay on the Eastern Shore³⁵.

Just as it does in the English version of the placename, the location called *Pilipgomimg* was named so after an individual, Pilip, who once lived there.

Half Island Cove was called *Aoaganeg*, referring to a portage, the beginning of the route southward to the Northwest Branch and Whitehead Harbour on the Eastern Shore³⁶.

Magteogatgeg, the Mi’kmaw name for Black Point, translates to ‘black head’ describing both its shape and dark colouring when viewed from the shore or a passing canoe.

Elnoeigomi, Indian Cove on the eastern side of Black Point clearly attests to Mi’kmaw occupancy at this location.

As indicated earlier, *Sebelogwokun*, or Fox Island, was and is known to Mi’kmaw as the place where they processed skins they had been harvesting in the area.

The Mikmaq toponym for Durells Island is *Siplogagneg*, a narrow channel. It provides specific descriptive information about the geographic feature that separates it from the mainland (now called The Tittle), which is useful to canoeists travelling along the shore or crossing over to the island.

These toponyms are but one piece of evidence of regular, consistent Mi’kmaw occupancy and land use of the Study Area reaching back into the pre-contact period.

As the economic cycle of the Mi’kmaw and their ancestors was inextricably tied to the seasonal and spatial ebb and flow of natural resources, the same plentiful marine resources that lured the Europeans would also have attracted during the pre-contact period the Aboriginal inhabitants from the surrounding region (that is the northeastern mainland and southeastern Cape Breton Island) to the Chedabucto shore.

³⁵ See fig. 13

³⁶ See fig. 13

Access to the Study Area and its resources during pre-contact times was principally by sea or land/river route.

The Strait of Canso provided a connection to and from the Georges Bay region, and the waters of Chedabucto Bay allowed canoe travel to and from southeastern Cape Breton Island. While the shores of the Northumberland Strait, Georges Bay and the Gulf of St. Lawrence would have been unnavigable due to the wide belt of drift ice that usually forms along these stretches of coast during the winter due to the prevailing wind conditions, Chedabucto Bay remains virtually ice-free and navigable.

Overland, a combination of waterways and trails/portages such as the Salmon and South River route or Milford Haven and Tracadie River offered links between the Study Area and St. Georges Bay. From the mouths of both Salmon and Milford Haven rivers at the west end of Chedabucto Bay an old trail existed that ran from there eastward along the shore all the way to today's community of Canso, with a spur line leading from Halfway Cove south to Whitehead Harbour³⁷. Research in other parts of Nova Scotia has shown that these ancient travel routes have remained remarkably stable through the centuries³⁸ and most can be expected to predate the arrival of Europeans.

Fig 13: Travel Routes

³⁷ The early settlers roughly followed the same route in constructing what was called the Old Coach Road, and later the current Hwy 316

³⁸ Lewis 2012; also Weiler 2008

With accessibility and the availability of food resources in place, a habitation site requires dry ground for wigwam construction, shelter from the elements, and a source of fresh water. Along the Study Area's shore, such attractive habitation sites are found at Halfway Cove, the mouth of Peas Brook, the Queensport Bay, Philips Harbour, Half Island Cove, Indian Cove, and The Tittle at Durell's Island³⁹. The archaeological potential of these locations can be expected to be high. During the winter months, suitable inland locations would have been used at some of the numerous lakes or streams.

To sum up, even though there is currently little archaeological data at hand to confirm pre-contact Aboriginal land use and occupancy in the Study Area, it is highly unlikely that the region would not have been occupied and used extensively given the rich resources and easy accessibility from other areas of the mainland as well as Cape Breton Island.

4.2. Post-Contact Historic Mi'kmaw Land Use & Occupancy prior to 1900

While historical records documenting Mi'kmaw presence in the Study Area are not plentiful, they do reach back to the early contact period, that is the early 1600s when the French were operating seasonal fishing stations at Canso⁴⁰.

One of the earliest references is found in a 1607 letter from Canso to the French habitation of Port Royal with the news that Indian graves had been opened and beaver skins removed from the deceased by Dutch fishermen, upon which the Indians responded with killing the person who had revealed the location of the graves. When in 1609 Henry Hudson entered Canso harbour to repair his ship, he mentions the existence of an Indian village there whose residents received him kindly⁴¹.

In the early contact years, the Study Area was rich enough in resources to lure French and English traders into the area for the specific purpose of trading with the local Mi'kmaw. Most of this trade was in furs and salmon.

A copper-kettle burial that eroded out of the bank at the mouth of the Salmon River in 2005 and was dated to about 1620 AD is both a confirmation of Mi'kmaw presence there as well as a testimony of early trading contacts between them and early European fishermen on this coast⁴².

³⁹ Not surprisingly, these locations were attractive to the newcomers as well and eventually became settled

⁴⁰ For details, see Appendix 5: Historical Records Review

⁴¹ Haynes 2007:9; Appendix 5: Historical Records Review

⁴² Lewis 2012; Rosenmeier 2012

In 1629, Captain Charles Daniel built a trading post at Chedabucto, the present location of Guysborough⁴³. This post was later taken over by Isaac de Razilly and in 1636 by Nicolas Denys, and became known as Fort St. Louis or Chédabouctou Fort. In 1650 Denys moved his post to the site of St. Peters (Fort Toulouse) in the hope of benefitting from protection by the Fortress of Louisbourg⁴⁴. Both those sites were chosen because they were located on traditional Mi'kmaw travel routes that lead from the Chedabucto Bay to the St. Georges Bay in the case of Fort St. Louis, and to southeastern Cape Breton Island in the case of Fort Toulouse.

Further to the south, a trading post was established on the Mary's River in the 1650s where French trader La Giraudiere supplied Mi'kmaw with spears, nets and other supplies for the salmon fishery in the St. Mary's River and the Gelneg Lakes areas.

Another indicator of a stable presence of Mi'kmaw in the Study Region is the fact that the Catholic Church found it appropriate to establish several missions in the area: In Canso in 1642, in Chedabucto in 1657, in Afton (today Paqtnkek) in 1717.

The trading establishments were generally located at major estuaries along the coast (on primary travel routes, that is) to take advantage of the fact that the fishery, especially for cod, mackerel and herring around Canso and salmon at Chedabucto, was a crucial element in the Mi'kmaw economy. However, the resource areas of the Mi'kmaw families trading at these posts reached far into the interior. The entire St. Mary's River watershed appears to have been particularly rich in fish (salmon and trout) and other wildlife and extensively used by Mi'kmaw, and historical documents report numerous camp site locations and a large burial ground⁴⁵. Heavily-frequented villages or camp sites were located at Country Harbour and Indian Harbour on the Eastern Shore, the south end of the travel route from the Chedabucto Shore. At Indian Harbour "there were once many villages of wigwams in the area as it was an ideal fishing and hunting area that provided all that the Micmac needed"⁴⁶.

In 1684 Frenchman La Valiliere robbed Nigascouet, a Mi'kmaq, who was on his way to Chedabucto with his season's harvest of 70 moose skins and 60 martin, 4 beaver and 2 otter pelts⁴⁷. These reports testify to the richness of the region and its economic significance to the Mi'kmaw.

⁴⁶ Hart 1975:157-158; Appendix 5: Historical Records Review

⁴⁷ Haynes 2007:45, Appendix 5: Historical Records Review

The one and only census of Acadians by French colonial officials in 1688 recorded 52 Mi'kmaw individuals at Chedabucto, or Guysborough (town)⁴⁸.

The 'Canso tribe of Indians', as they were called at the time, were highly mobile travelling between the Chedabucto coast and Afton along what became known as the 'Roman Valley'⁴⁹. Generally they tended to spend winters in Afton and spring, summer and fall at Chedabucto and smaller fishing camps along the coast eastward up to Canso⁵⁰. In the 1680s a Mi'kmaw village was reported to exist one mile west of Chedabucto/Fort St. Louis. The post "flourished with 51 [non-Mi'kmaw] inhabitants and 52 Indians"⁵¹.

At Canso, a continuous Mi'kmaw presence is clearly documented. An archaeological find of a cache of projectile points on Grassy Island was dated to about 500 AD⁵². Early historical documents attest to the continuation of Mi'kmaw occupancy here with references to a Mi'kmaw village just across from the Canso gut⁵³. Another seasonal Mi'kmaw encampment that had persisted until the 1960s was located at Indian Cove on Durells Island.

During the 1700s the Mi'kmaw were increasingly drawn into the struggle between the French and English colonists over lands and resources, in particular the lucrative Canso fishery. In 1720, Gov. Phillips described Canso as "by far the most important commercial centre in Nova Scotia"⁵⁴.

Generally siding with the French, the Mi'kmaw suffered severely losing many lives and access to their coastal harvesting areas. The repression of the aboriginal population culminated in Gov. Edward Cornwallis' orders to "annoy, distress & destroy the Indians every where" and that "a Premium be promised of ten guineas for every Micmac killed or taken prisoner"⁵⁵.

Nevertheless, the first two settlers to settle in the early 1760s at Chedabucto Bay, Elias and John Cook were welcomed by the Mi'kmaw and received assistance from them⁵⁶.

During the early 1700s, the Province began issuing licences of occupation to some of the Mi'kmaw in response to petitions. These were granted initially for harvesting timber or the use of shoreline sections for fishing, then after 1782 for homestead lots as well⁵⁷.

⁵⁶ Hart 1975:54, 144; Appendix 5: Historical Records Review

⁵⁷ Robertson 2000

However, no licences of occupation are known to have been granted within the Study Area.

Historical documents attest to a sharp increase of Mi'kmaw in the study area as a response to the small pox, whooping cough and measles outbreaks in 1801 and 1802. Many Mi'kmaw families were fleeing larger settlements and reserves for the relative isolation of the Guysborough area. Fourteen families from Antigonish (now Paqtnkek) and five from Pictou (now Pictou Landing) were reported to have moved to the "Salmon River encampment"⁵⁸. How many of those families remained in the area once the outbreak subsided is unclear.

During the 1800s, increasing pressures through the expanding commercial fishery and improving fishing technology, as well as the growing numbers of settlers in the Study Area took a toll on the area's fish, wildlife and forestry resources⁵⁹. Competition for declining resources, land grants to settlers, fishing privileges granted to commercial interests, and government policies pressuring Mi'kmaw to adopt agriculture increasingly marginalized the Mi'kmaw population⁶⁰.

Over decades, Mi'kmaw as well as concerned Indian Agents such as Abraham Gesner and John McKinnon submitted a series of petitions to the House of Assembly requesting aid and the protection of Mi'kmaw lands and livelihoods.

On April 6, 1845, for example, a petition by John Battist, Joseph Battist and Francis Cope was presented asking for land "in the neighbourhood of which they have many years sojourned. Each year their hunting ground and subsistence there from are more scanty and precarious"⁶¹.

Indian Commissioner Abraham Gesner submitted on February 2, 1848 a petition signed by eleven Mi'kmaw Chiefs and Captains "to prevent the Hunting of Moose by Dogs and to Secure to Them Their Fisheries". The letter stated that the white man's hunting style was threatening the moose population as they only take the skins leaving the rest behind. It requested Mi'kmaw be allowed to spear salmon in any of the rivers in the province⁶².

On December 8, 1848 another petition was submitted by Newel Joe and Newel Dennis asking for relief on behalf of the families Joe, Dennis, Grigwell, Lewie, Toney, Cristifer, Glema, Louland, Michel, Potet, Forit, French, Caber, Prosper and Sabia on the St. Mary's River. 200-300 moose were taken by white people in the St. Mary's area in the

⁶² Haigh 2000:63; Appendix 5: Historical Records Review

previous spring alone. Fish and game for the Mi'kmaw families were getting scarce and a crop failure that year added to their precarious situation⁶³.

In 1872 Indian Agent John McKinnon reports to Secretary of State Hon. Joseph Howe on the condition of the Mi'kmaw in the District of Guysborough, listing the families: Gabril, Prosper, Joe, Sallome, Pictob, Scotchman, Marble, Batist, Fraser, Marshal, Nicholas, Cope, Lafford, Newl, Tony, Brassay, Meuse, Tom, Phillip, Paul, McKeugir and McMillan. Even though they had cultivated large tracts of land with hay, potatoes and oats their condition was poor since their fishery was not successful⁶⁴.

On August 23, 1872 Angus Cameron writes a letter to Hon. Joseph Howe reporting that the Mi'kmaw are being deprived of their burial ground in St. Mary's that they had been using for 150 years, located at Sheep Island at the Forks or Glenelg Lake⁶⁵.

Between 1861 and 1900, Nova Scotia census and Indian Affairs records report the Mi'kmaw population of Guysborough County to range between 88 and 180, with the exception of the years 1872-73 and 1898-1900 when numbers register between 33 and 48⁶⁶. It is known, however, that census records are not reliable when it comes to the Mi'kmaw population generally understating actual numbers of residents⁶⁷.

Beginning in the 1820, the Province began establishing small reserves across Nova Scotia, 46 in total. None however were set up within the Study Area even though Mi'kmaw communities existed in Canso, Salmon River (or Cooks Cove as it is known today), Dort's Cove, and seasonal encampments at various other places.

After Confederation, the federal Indian Affairs Branch maintained an official Centralization Policy during the 1940s and 1950s, partly as a way of reducing administrative costs in the province and partly in "response to complaints about the presence of Mi'kmaw near non-aboriginal communities"⁶⁸. The goal of this policy to centralize the Mi'kmaw population in the two reserves of Shubenacadie on the mainland and Eskasoni on Cape Breton Island ultimately failed. Many families resisted the pressure to relocate or ended up moving back to their previous homes or reserves.

However, the Centralization Policy "did fundamentally alter the geographic distribution of Mi'kmaw in the province"⁶⁹ and left a number of reserves unoccupied. With the failure of the policy evident, another reorganization in 1957-58 brought about and confirmed the current pattern of Mi'kmaw First Nation communities.

⁶⁹ Kenny & Parenteau Research Assoc. 2000:v

These events caused considerable disruptions in traditional settlement and land use patterns and further restricted access to resources for several generations of Mi'kmaw. Through the growing use of motorized transportation since the mid-20th century Mi'kmaw families were able to re-capture some of their traditional harvesting areas, as far as they had not become subject to competing uses by the dominant society such as municipal, agricultural or industrial development, parks and protected areas.

5. Section III: CONTEMPORARY MI'KMAW LAND AND RESOURCE USES

Following the generally accepted definition, the term 'contemporary land use' is used here to describe land and resource uses, and occupancy activities and locations, within living memory.

High mobility has always been a crucial characteristic of the land use patterns of Mi'kmaw individuals and families. However, as long as resources remained predictable, it was natural that hunters, fishers and harvesters of other natural resources tended to utilize areas that they are intimately familiar with and pass on this familiarity to their children. As a consequence, spatial land use patterns of Mi'kmaw families have in general remained fairly stable. However, the centralization policy, increasing settlement density, and motorized transportation and the associated infrastructure have brought about some adjustments.

John Prosper, Chief of Bayfield (Paqtnkek) in the early 1960s may serve as an example of a highly mobile Mi'kmaw harvester utilizing the resources of the entire region. He was born into the 'Canso band' and spent winters at Framboise Cove, Cape Breton, spearing eels and would come to Canso to fish in the spring⁷⁰.

Until the 1960s, the Study Area and its resources were extensively use by members of the three closest communities of Paqtnkek, Chapel Island and Eskasoni. But families with ties to Millbrook as well as the aforementioned also lived in the Mi'kmaw community of Salmon River, or Cooks Cove, on several locations in Guysborough Harbour, on Clam Pond and Black Pond at Clam Harbour Beach, and in Dort's Cove. On the south side of the mouth of the Salmon River was a small Mi'kmaw community, then known as the Mountain Road community. In addition to their subsistence harvesting they carried out small-scale commercial activities such as the manufacture

⁷⁰ Letter by archaeologist John Erskine to G.Campbell, Sydney Academy Principal, dated Feb 6, 1965; Appendix 5: Historical Records Review

and sale of axe handles, baskets, barrels and snowshoes to the area's non-native settlers and fishermen and the people of Guysborough town⁷¹.

Also up to the 1960s, a number of families from Eskasoni, Chapel Island and even Isle Madame maintained a seasonal settlement at Indian Cove (hence the name) on the east side of Durells Island.

The Canso area, and Durells Island and Betsey's Beach in particular, were of the primary travel route between Cape Breton Island and the Nova Scotia mainland. Local residents recall Mi'kmaw, sometimes more than 100 individuals, arriving on Durells Island in March or April and staying until October. It was used during summers for fishing and making baskets which were then sold to the townspeople of Canso and some other mainland and Cape Breton communities⁷².

The Mi'kmaw families of all those settlements, permanent and seasonal, utilized resources located within the study area⁷³. These included marine fish and shellfish resources along the coast, coastal wildlife species (shorebirds, etc.), inland fish and wildlife species, specialty woods for basket making, tools (ax handles, snowshoe frames, barrels) and other crafts, food and medicinal plants, etc.

Even though these settlements and seasonal encampments were given up around the mid-twentieth century, harvesting activities by some members of the surrounding communities (Paqtnkek, Pictou Landing, Chapel Island, Millbrook) are still ongoing, albeit at a lower intensity⁷⁴. Motorized transportation such as all-terrain vehicles, snowmobiles, pick-up trucks, engine-powered boats put the Study Area's resources within relatively easy reach from any of these reserve communities.

The fact that the waters along the southern Chedabucto coastline, unlike the those of the St. George's Bay, do generally not freeze or get clogged with ice flows⁷⁵ offers virtually unimpeded fishing during the winter months to fishers from Paqtnkek and Pictou Landing.

⁷¹ Prosper 2012, Rosenmeier 2012

⁷² Martha Murphy, Canso Museum, personal communication June 2012, Davis Archaeological Consultants 2004: 24-26, Ferguson 2011, Rosenmeier 2012

⁷³ Prosper 2012, Rosenmeier 2012

⁷⁴ Prosper 2012

⁷⁵ Due to the prevailing winds. Prosper 2012

The survey of current Mi'kmaw land use of the Study Area revealed the following activities and patterns⁷⁶:

Marine resources reported to be harvested along the Study Area portion of the Chedabucto coast include mackerel, herring, cod, haddock, urchins, mussels, oysters, clams, as well as snow crab in deeper waters. The sandbar extending between Fox Island and the mainland is known as a productive shellfish bed.

Reported freshwater fishery resources are salmon, trout and eel. Moose and deer are harvested, as well as various small game species. General trapping activities were indicated to occur within the study area as well. Even though the region does not to be particularly attractive as a waterfowl staging or breeding area, Canada geese are indicated as a waterfowl species being harvested here.

Plant resources include specialty woods such as maple, ash, birch as well as birch bark for tools, crafts and decorative items. Berries of various types are reported to be harvested in the study region. These include blueberries, cranberries, strawberries and fox berries. Several species of medicinal plants⁷⁷ are being collected here, as well as plants used for ceremonial purposes.

Within the Project Area itself, harvesting of the following types of resources are being reported:

Cod, herring, mackerel, oyster and urchin fishing were indicated to occur along its shore.

With respect to terrestrial harvesting activities, moose, deer and goose hunting were identified, as well the trapping of furbearers.

Plant resources harvested in this area consist of maple, various berry species, wild caraway seeds, and medicinal plants.

For the purpose of this assessment, Mi'kmaw land and resource use activities are grouped into five categories: Hunting/fishing, gathering food/medicinal plants, wood and wood products, ceremonial/spiritual sites, burial/birth places, and habitation/camp sites.

Reported activities are summarized in the following table (Table 1) and on the following map (Figures 14 & 15).

⁷⁶ See map, appendix 6. Mi'kmaq land use activities may not be limited to the activities, species, and harvesting areas identified here.

⁷⁷ Specific plant names withheld upon informants' requests and for protection of species

LAND/RESOURCE USE CATEGORY	REPORTED ACTIVITIES/RESOURCES
Hunting/Fishing Sites/Areas	Moose, deer, hare, porcupine, furbearers, grouse, geese, trout, haddock, mackerel, herring, cod, eel, lobster, urchin, mussel, oyster, scallop
Food/Medicinal Plants Gathering	Caraway seeds, hazelnuts, chokecherries, strawberries, blueberries, cranberries, fox berries, Labrador tea, various medicinal plants
Wood, Wood Products	Maple, birch bark
Ceremonial/Spiritual Sites	Ceremonial plant, decoration plant
Burial/Birth Places	(None reported)
Habitation/Camp Sites	Camp site

Tab. 1: Summary of Reported Land/Resource Use Activities in the Study Area

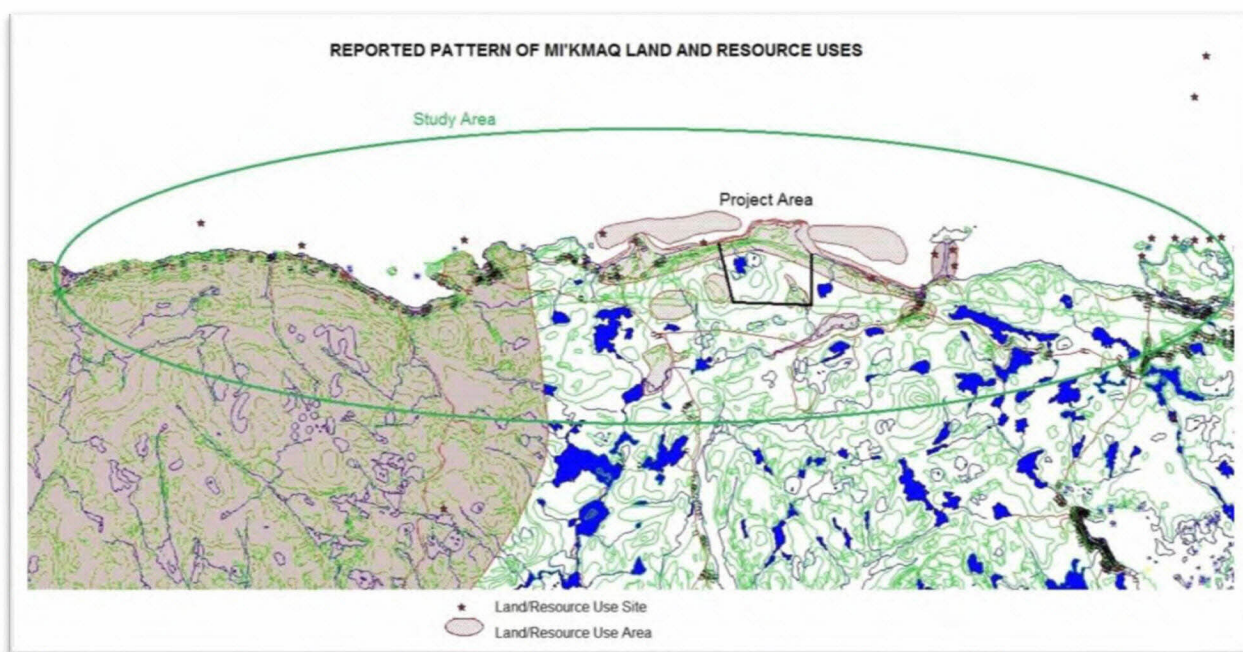

Fig. 14: Reported Pattern of Mi'kmaw Land and Resource Uses

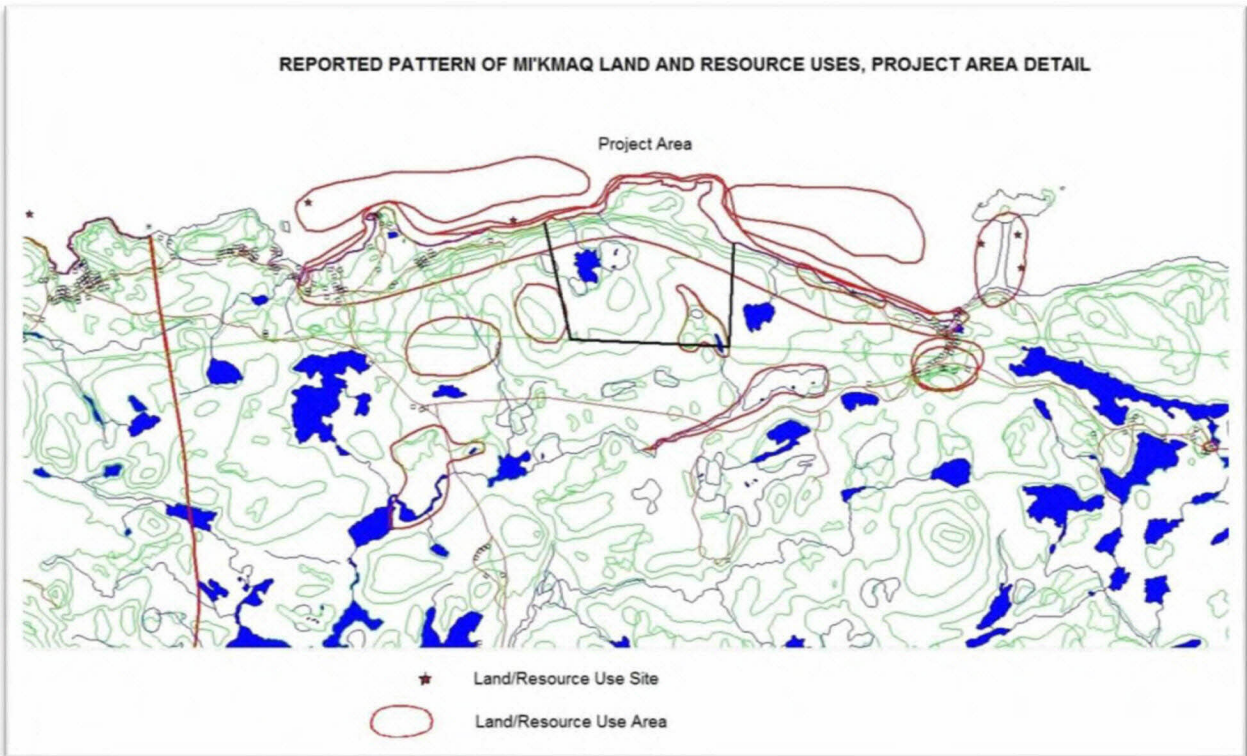

Fig. 15: Reported Pattern of Mi'kmaw Land and Resource Uses, Project Area Detail

6. Section IV: RESERVE LANDS AND SPECIFIC CLAIMS

There are no Indian reserves located within the Study Area or Project Area. The nearest reserves are Chapel Island IR 5, about 50 kilometres⁷⁸ to the northeast on Cape Breton Island, and Paqtnekek IR 23, approximately 55 kilometres to the northwest near St. George's Bay.

A review of outstanding specific claims was undertaken by MAPS.

No specific claims are pending within the Study Area. This does not imply, however, that a specific land claim may not arise in the future.

⁷⁸ Linear distance

7. Section V: IMPACTS AND MITIGATIONS

7.1. Potential Project Impacts on Mi'kmaw Land and Resource Uses

The review of historic and contemporary (within living memory) Mi'kmaw land use and occupancy in the Study and Project areas confirms and documents Mi'kmaw use and occupation.

Based on the above findings potential project impacts are expected on several levels:

- 1) There is a potential for the disturbance of hitherto unidentified archaeological resources during the construction of the infrastructure (access road, processing facility, shipping terminal) associated with the project, as well as the quarry operation itself.
- 2) The permanent loss of wildlife and plant resources within the immediate project footprint is inevitable. This may be as a result of the physical destruction, removal or displacement of specimens, or restriction of access to the location as a potential harvesting area.
- 3) Noise disturbance resulting from increased human presence, vehicular traffic, blasting, and general mining activities will adversely impacts local wildlife resources.
- 4) Dust and other airborne pollutants created during the mining, crushing and transport of the product are expected to settle on the vegetation, wetlands and water bodies within a certain corridor along the access road, and a certain radius of the quarry pit as well as the shipping terminal, depending on prevailing winds. This will depreciate the quality of local food and medicinal plants for human consumption as well as the quality of animal browse and water/wetland habitat.
- 5) The marine and shoreline habitats surrounding the shipping terminal are threatened by dust contamination, the potential for accidental aggregate spillage during loading, and possible contamination resulting from petroleum products associated with cargo vessels. The potential effects of these kinds of events on the near-shore fishery is undetermined.

The criteria for assessing the significance of potential impacts on Mi'kmaw land and resource uses in the Study Area are:

- a) The nature and volume of current land and resource uses,
- b) the uniqueness of the land and resources in question,
- c) the cultural and spiritual significance of the land and resources, and
- d) Mi'kmaw constitutionally protected rights and interests in lands and resources.

POTENTIAL IMPACTS	ASSESSMENT OF SIGNIFICANCE
1) Disturbance of archaeological resources	Being the only source of information on Mi'kmaw pre-contact history, land use, occupancy and culture. Archaeological resources are irreplaceable and of extreme importance.
2) Permanent loss of wildlife and plant resources within the immediate project footprint	The species of significance to Mi'kmaw identified within the Project Areas, in particular medicinal plants, are also present within the surrounding areas. The permanent loss of some of (or access to) these specimens within the Project Area is not expected to significantly limit Mi'kmaw use of these resources.
3) Noise disturbance will adversely impacts local wildlife resources	As the frequencies, sound levels and the radius of the noise harassment/injury threshold of 92 dBA ⁷⁹ resulting from the project's blasting activities are undetermined, the spatial range of these impacts on wildlife is unknown. Because of the local nature of these impacts, their significance on local Mi'kmaw harvesting activities is limited.
4) Contamination of surrounding vegetation, wetlands and water bodies through dust and other airborne pollutants.	The level of depreciation of local food and medicinal plants for human consumption is undetermined, and so are the impacts of a deteriorating quality of animal browse and water/wetland habitats on local fish and wildlife. Even though the radius of these impacts will undoubtedly extend beyond the boundaries of the Project Area, their effects on Mi'kmaw resource activities is expected to be limited.
5) Contamination of marine and shoreline habitats surrounding the shipping terminal through dust, accidental aggregate spillage and possible fuel, oil or waste discharge associated with cargo vessels.	While dust contamination associated with the project activities seems unavoidable, the likelihood of aggregate spillage and fuel/oil/waste pollution is undetermined. Potential impacts of such occurrences on the surrounding marine and shoreline ecosystems are also unassessed, but may be wider-ranging depending on factors such as season and marine currents. The significance of such potential impacts on the Mi'kmaw fishery is undetermined.

Tab. 2: Significance of Potential Project Impacts of Mi'kmaw Land & Resource Uses

Washington State Dept of Transportation 2012:, p. 7.11

7.2. Recommendations

- 1) It is recommended that, prior to construction, the archeological potential of the Project Area is assessed by a qualified archaeologist in adherence to the Nova Scotia Special Places Protection Act *R.S., c.438, s.1.*⁸⁰ and any area determined to be of high potential be excavated.
Should any archaeological artifacts be encountered during the construction or operation of the Project, all work should be halted and immediate contact be made with the Nova Scotia Museum of Natural History's Special Places Coordinator Laura Bennett (902-424-6425) or Archaeology Curator (902-424-6461), and the Confederacy of Mainland Mi'kmaq's History and Culture Coordinator Tim Bernard (902-895-6385).
- 2) During the construction and operation phase, particular attention should be paid towards minimizing the spread of airborne pollutants generated as a result of blasting, quarrying, crushing and aggregate transport, and their impacts on the surrounding areas' vegetation and water bodies, with the local average speed and direction of the prevailing winds determining the potentially affected zone.
- 3) During the operation phase, strict operations protocols need to be in place in order to minimize the potential for accidental spillage of aggregate and the associated fine-grained waste during loading at the shipping terminal in order to avoid seabed contamination. Depending on local tidal action and currents, the extent of potentially impacted area and associated marine and shoreline resources may be significant.

**Erdene Resource Development Corp.:
Black Point Quarry Project
Project Information Sheet**

Erdene Resource Development Corp.
Black Point Quarry Project
Project Information Sheet

Project Overview

Erdene Resource Development Corp. (Erdene) of Dartmouth, Nova Scotia proposes development of the Black Point Aggregate Quarry within Guysborough County, Nova Scotia. The proposed project area is situated on a 280 hectare (ha) property located along the southern rim of the Chedabucto Bay approximately 10 kilometres (km) west of the Town of Canso (Figure 1) leased from the Municipality of the District of Guysborough (MODG). After an extensive five year aggregate exploration program conducted by Erdene, the Black Point site was selected as a top prospect for future quarry development. The property, which is currently zoned Heavy Industrial (M-2), hosts a large tonnage resource of high quality granite, immediately situated on sheltered, ice-free tidal water. This location provides direct access to international shipping lanes facilitating efficient transportation of the aggregate resource to US and Caribbean markets via bulk carrier vessels.

Project development will generally include pit development and aggregate production (drilling, blasting, processing, and stockpiling) along with the construction and operation of a marine terminal adjacent to the quarry in Chedabucto Bay, where processed aggregate will be off-loaded in Panamax-sized ships (up to 70,000 tonnes) and transported to ports along the eastern and Gulf coast markets of the US and potentially markets in Canada and the Caribbean.

The anticipated average annual production rate will exceed 1.0 million tonnes with an anticipated peak production rate of 6.5 million tonnes per year. The anticipated operating schedule is 15 hrs/day, 7 days/week; on a year-round basis and weather permitting. Estimated rock reserves in the proposed quarry area are in the order of 250 million tonnes. Quarry operations are expected to take place over a period of approximately 50 years, depending on the demand for aggregate.

The land to be developed is primarily owned by the MODG, as per a recent land transfer agreement with the Provincial Crown Lands Group. With the recent Cabinet approval of the land transaction and the unwavering local political support, Erdene feels that it is time to advance the Project.

Construction aggregates are comprised primarily of crushed stone, natural sands, and gravel. These resources are a necessity for the development and maintenance of modern infrastructure. Although construction aggregates have numerous end uses, their general application is in the production of building materials such as concrete and asphalt. The US consumed almost 10 metric tonnes of aggregate per person in 2007 (USGS) totalling a volume of more than 3 billion tonnes. Total volumes have decreased in the US post 2007 to 2 billion tonnes as a direct result of the global economic downturn. Recent statistics indicate US per capita usage averaged 7 tonnes in 2010 (USGS).

While construction aggregates are relatively abundant they must be located in accessible areas to be of economic value; as they are low priced, high volume commodities and the cost of transporting to the market can easily exceed the value of the material. Aggregates must also meet strict quality requirements related to the chemical and physical characteristics of the rock. Many rock types do not meet these quality specifications and cannot qualify as viable construction aggregate resources.

In the US market, the majority (80% or more) of aggregates are transported by truck from the quarried source to the consumer. This form of transport is expensive and limits the typical aggregate operation to a market radius of about 80 km. Coastal markets within the US are increasing the use of high volume modes of transportation such as rail and ship to minimize costs. The south eastern US aggregate market is a prime target for bulk transported aggregate due in part to the geologic absence of suitable aggregate resources in coastal areas. For example the Martin Marietta Materials' quarry at Aulds Cove, Nova Scotia shipped nearly 300 vessels of crushed stone to Florida ports between 2004 and 2009 (Eastern US Seaboard Market Study; Archibald Consulting Services, LLC; November 2009).

Economic Benefits

The proposed Black Point operation would provide many family-waged jobs to Guysborough and surrounding communities. An estimated 155 persons would be directly and indirectly employed in Guysborough County during the site development phase which would include wharf and aggregate

plant construction. An estimated 123 direct and indirect full-time jobs would be created during the peak operation phase of the quarry with an estimated output of 6.5 million tonnes of material per year. Peak production is estimated to occur within approximately 10 years of quarry development. All employment estimates were determined by a third party consultant (Gardner Pinfold Economic Impact Analysis).

Environmental Assessment Triggers

Section 5(1) of the *Canadian Environmental Assessment Act (CEAA)* stipulates that a federal environmental assessment (EA) is required when a federal authority is involved in a project. There are at least two activities pursuant to the Law List Regulations that are anticipated to trigger a federal EA for the Black Point Quarry Project: the construction of a wharf in navigable waters as regulated by the *Navigable Waters Protection Act* (administered by Transport Canada), and the potential harmful alteration, disruption or destruction (HADD) of fish habitat as regulated by the *Fisheries Act* administered by Fisheries and Oceans Canada (DFO). A third potential trigger is for the potential storage and manufacture of explosives as regulated by the *Explosives Act* administered by Natural Resources Canada.

In accordance with Section 21(1) of *CEAA* and the *Comprehensive Study List Regulations (CSLR)*, the Project will require a comprehensive study level assessment. Under the *CSLR*, a Comprehensive Study is required for a stone quarry with a production capacity of 1,000,000 t/yr or more. Furthermore, a marine terminal designed to handle vessels larger than 25,000 DWT also require a comprehensive study. As such, the Canadian Environmental Assessment Agency (CEA Agency) will exercise the powers and perform the duties and functions of the responsible authority, according to recent amendments to *CEAA*.

In consideration of the resource based nature of the Project, the level of environmental assessment required, and the multi-jurisdictional requirements, it is anticipated that the federal review of the Project may also be overseen and tracked by the Major Projects Management Office (MPMO).

In addition to the above federal EA requirements, the Project also requires completion of a provincial environmental assessment pursuant to Nova Scotia's *Environment Act* and *Environmental Assessment Regulations*. As a quarry that is larger than 4 ha and an undertaking that may disrupt wetlands in excess of 2 ha, the proposed Project is considered to be a Class 1 Undertaking, which will require the submission of an Environmental Assessment Registration Document. Further requirements for the provincial EA process have been established in the Guide to Preparing an EA Registration Document for Pit and Quarry Developments in Nova Scotia (NSE 2009).

It is desired and anticipated that a Federal-Provincial Environmental Assessment Agreement be negotiated by all relevant agencies such that the two EA processes would be harmonized.

Design and Component Studies

In support of the Project design and environmental assessment, Erdene has completed the following studies to date in an effort to advance the project:

- Fatal Flaw Study - AMEC (2007)
- Extensive core drilling & testing - Logan Drilling/AMEC (2007-08)
- Detailed chemical and physical testing of the resource - AMEC (2008)
- Conceptual wharf design & redesign, wind & wave analysis & capital estimates - Eastpoint Engineering & CBCL (2008 & 2010)
- Detailed US marketing studies NE and SE - Lampl Herbert & Archibald Consulting (2007 & 2009)
- Conceptual plant design & capital estimates - Mine Equipment & Design (2008)
- Communication strategy & plan - MT&L (2008)
- Economic Impact Study - Gardner Pinfold (2010)
- Conceptual mine plans - Minetech (2010)

- Baseline environmental studies (terrestrial and marine) - AMEC & AECOM (2010, 2011)
- Preliminary aboriginal consultation - AMEC (2011)
- Internal Scoping Study & financial modeling (on-going)

Additional studies to be completed include: wetland delineation; baseline noise data collection; hydrology and hydrogeology; and acquisition of LIDAR.

Consultation and Engagement

The Black Point Quarry is expected to be a project of regional significance. As such, Erdene will undertake a comprehensive and open communications campaign to engage and share information about the project with as many stakeholders as possible to make the project a reality. To aid in this endeavor, Erdene has retained MT&L Public Relations to provide guidance in the development and management of the communication campaign and to ensure consistent and accurate messaging. Some of the tools Erdene plans to use to effectively communicate the merits of the project are:

- A full time community development manager based in Guysborough so that an open door communication atmosphere exists.
- A project-specific web site to keep stakeholders current on all information and project specific material.
- Periodic newsletters to all stakeholders as new information becomes available.
- A Community Liaison Committee (CLC) comprised of interested citizens to meet periodically during construction and operation to address community concerns.
- Regular stakeholder meetings throughout the permitting process to ensure all interested parties are hearing the information first hand from company officials.

Furthermore, Erdene has retained AMEC to continue with First Nations engagement.

Environmental Impact Statement

Erdene has retained AECOM to prepare the Environmental Impact Statement (EIS) report for the Project. The EIS report will evaluate potential environmental effects of the Project and will focus on those aspects of the environment of most concern such as: rare and sensitive flora; wetlands; wildlife and wildlife habitat; fish and fish habitat (marine and fresh water); surface and groundwater resources; atmospheric resources (air quality and noise); archaeological and heritage resources; land use; commercial fisheries; and current use of traditional land and resources by Aboriginal People. The EIS report will identify appropriate mitigation and monitoring to minimize these effects and will assess the residual effects and their significance.

Foreword

The enclosed Mi'kmaq Ecological Knowledge Study Protocol (MEKS Protocol) represents an important milestone for the Nova Scotia Mi'kmaq to manage the collection and distribution of Mi'kmaq Ecological Knowledge throughout Nova Scotia. The protection of Mi'kmaq Ecological Knowledge¹ (MEK) has been highlighted as a key issue through the Assembly of Nova Scotia Mi'kmaq Chiefs (the "Assembly"). The Assembly exists as an institution of governance for the Mi'kmaq of Nova Scotia with respect to issues of common interest and concern. It includes representation from all the thirteen Mi'kmaq Bands located throughout the province of Nova Scotia.

The purpose of the MEKS Protocol is to identify the essential components of an MEKS in accordance with the concerns and aspirations of the Assembly. By enacting this MEKS Protocol, the Assembly trusts that it will contribute to the following objectives: acknowledgment and respect of Mi'kmaq cultural practices, values and traditions; preservation of a Mi'kmaq cultural identity; an open, transparent and accountable MEKS process that is receptive to the unique needs of the Nova Scotia Mi'kmaq.

Although this MEKS Protocol will serve as the primary basis for any proposed MEKS in Nova Scotia, it should not be read in isolation from other Mi'kmaq regional or provincial processes regarding MEKS. Furthermore, the MEKS Protocol does not operate as to replace other applicable Mi'kmaq research ethics practices or procedures that exist or may be created from time to time. Where said provincial and regional processes exist, this MEK Protocol shall be liberally interpreted for consistency with said regional and provincial processes. If in the event that there is a clear conflict between this MEKS Protocol and other provincial and regional processes, this MEKS Protocol shall take precedence and prevail.

The MEKS Protocol is also a working or rolling document that through the course of time will undergo further discussion and change. Therefore, when undertaking an MEKS in Nova Scotia, please check for the latest revised document to ensure that any proposed MEKS practices are in keeping with the most recent positions and perspectives of the Nova Scotia Mi'kmaq.

¹ Throughout this document, Mi'kmaq Ecological Knowledge is intended to reflect the concept and meaning of Aboriginal Traditional Knowledge. However, it should also be noted that Mi'kmaq Ecological Knowledge is also specific to the unique practices, culture, values and traditions that the Mi'kmaq people have to all components of the natural environment.

Section I – Introduction

Since time immemorial, the Mi'kmaq have used and occupied their traditional territory known as Mi'kma'ki which includes Nova Scotia, Prince Edward Island, New Brunswick and parts of Quebec, Newfoundland and the northeastern part of Maine. Mi'kmaq Paleo-Indian sites in Nova Scotia provide archaeological evidence of Mi'kmaq occupation for over 10,500 years. Today, the Mi'kmaq continue to use and occupy Mi'kma'ki and share a deep and profound relationship with their traditional lands.²

In Mi'kmaq cultural tradition, the Mi'kmaq utilize Netukulimk – a Mi'kmawey concept which includes the use of the natural bounty provided by the Creator for the self-support and well-being of the individual and the community at large. Netukulimk also encompasses ecological beliefs through the interplay of collective and individual responsibilities of the Mi'kmaq to the natural world. Such relationships with the land are holistic in nature and consider many aspects of the natural and spiritual world. These include, but are not limited to, land/marine resource use, management, conservation and Mi'kmaq spiritual beliefs.

Throughout history and today, Mi'kmaq subsistence and spiritual practices encompass the natural world in a manner that is, at times, distinct from understandings inherent in western society. The Mi'kmaq do not perceive the natural and spiritual world as separate and distinct spheres. This longstanding relationship that the Mi'kmaq have maintained for centuries with their natural surroundings is the foundation for MEK. For the Mi'kmaq, MEK is not just simply an exercise in the examination of Mi'kmaq land and resource use; rather, it also involves a unique approach to the gaining of this information through Mi'kmaq cultural practices and tradition.

Secondly, MEK is not static. It is constantly reanalyzed and tested through the experiences of new generations of Mi'kmaq. This experience considers and incorporates new and emerging resource issues thus enabling reliable MEK data to emerge through a shared experience. In light of this cultural dialogue or practice, it is important that a guiding and interpretive framework be advanced to take into account these unique practices, beliefs and perspectives through a respect for cultural difference.

² Taken from confidential source material from: The Confederacy of Mainland Mi'kmaq, Membertou Corporate Inc., and the Unama'ki Institute of Natural Resources.

Section II – Definitions

2.1 Within this Mi'kmaq Ecological Knowledge Study Protocol:

“Assembly” means the Assembly of Nova Scotia Mi'kmaq Chiefs which operates as an institution of governance for the Mi'kmaq of Nova Scotia.

“Consultant” means a company, group or individual that has primary responsibility to undertake and deliver a Mi'kmaq Ecological Study within the province of Nova Scotia.

“Consultation” means any Crown and Mi'kmaq government³ discussion, negotiation or meeting used to justify Crown infringement of Aboriginal and treaty rights.

“Government” means any federal, provincial or municipal department, agent or representative.

“MEK” means Mi'kmaq Ecological Knowledge and includes the collection and adaptation of knowledge that Mi'kmaq people have with all components of the natural environment and the interrelationships that exist between all life forms from a unique historical, cultural and spiritual perspective.

“MEKS Protocol” means the Mi'kmaq Ecological Knowledge Study Protocol and includes all attached appendices and amendments that may be made from time to time.

“Mi'kmaq Ecological Knowledge Study” means all components related to the planning, collection, analysis, reporting and distribution of Mi'kmaq Ecological Knowledge in Nova Scotia.

“MEK Report” means any document that considers MEK data pursuant to any Project defined in this MEKS Protocol.

“Mi'kmaq Community” means any of the Mi'kmaq First Nation Bands, affiliated communities or other Mi'kmaq communities that exist throughout Nova Scotia.

“Mi'kmaq Participant” means any person of Mi'kmaq descent who has agreed to participate in an MEKS.

³ Mi'kmaq Government is intended to mean any of the thirteen Nova Scotia Mi'kmaq Bands in whole or in part.

"Netukulimk" means the Mi'kmaq use of the Creator's natural bounty for self-support and well-being and the interplay of collective and individual responsibilities that the Mi'kmaq have to the natural world.

"Project" means any undertaking that has triggered an MEKS to occur.

"Proponent Company" means a company, group or person responsible for undertaking a Project.

Section III – Interpretation

3.1 Nothing in this MEKS Protocol or any related discussions, communications or documentation shall be interpreted as to abrogate, derogate, or in any way, affect, limit or detract from the existing Aboriginal and treaty rights that the Mi'kmaq people individually and collectively enjoy throughout Nova Scotia.

3.2 For greater certainty to Section 3.1, nothing in this document shall be interpreted as Consultation for purposes of justifying an infringement on Mi'kmaq Aboriginal or Treaty rights that exist or may be found to exist in the future.

3.3 This MEKS Protocol shall be read to compliment any Mi'kmaq regional or provincial processes that pertain to MEK data collection and, in the event of a conflict between said process(s) and this Protocol, this Protocol shall take precedence and prevail.

Section IV – MEKS Methodology

4.1 MEKS methodology provides guidelines and standards⁴ on suggested practices and procedures relevant to the planning/design, development, implementation and reporting stages of an MEKS.

Phase I - Planning and Design

This Phase includes all preliminary work specific to the development of an MEKS. Although Consultants may differ on the approach or substance of the components contained within this Phase, it is a requirement that an MEKS both consider and address each of the following elements:

⁴ This MEKS Protocol provides both standards and recommended guidelines for all stages of an MEKS. For greater certainty, guidelines should be interpreted as general "rules of thumb" or "best practices." Standards exist as requirements or obligations that are to be followed at various stages of an MEKS.

A) Communications:

Communication is a key activity to the Phase I component of the MEKS. At the front end of the MEKS process, the Consultant shall draft a letter outlining its intention to the proposed MEKS process. At a minimum, this letter should include the following:

- information on the Proponent Company
- outline the nature of the Project
- include background information on the Consultant
- outline the purpose of the MEKS
- specify the proposed MEKS process and related activities
- comment on the intended use of the MEKS
- provide relevant contact information
- provide an opportunity for feedback/input

The letter should be sent to the Assembly, Union of Nova Scotia Indians, The Confederacy of Mainland Mi'kmaq, Kwi'mu'kw Maw-klusuaqn and the political leadership of each Mi'kmaq First Nation Band that the Consultant intends to collect MEKS data within. For a list of relevant contact persons and Mi'kmaq Bands see Appendix B.

B) Research Principles and Protocols – Mi'kmaw Ethics Watch:

The Research Principles and Protocols provides a prescribed approval process to the collection, analysis and reporting of research data generated from Mi'kmaq First Nation communities throughout the province of Nova Scotia. The Consultant should consider the Research Principles and Protocols as an additional research process requirement in the early planning stages of an MEKS. For a copy of the Mi'kmaq Research Ethics Protocol, see Appendix D.

Phase II - Delivery and Implementation:

This Phase includes all work specific to the delivery and implementation of a MEKS in Nova Scotia. As previously stated, although Consultants may differ on the approach or substance contained within this Phase, it is highly recommended that a MEKS both consider and address, at a minimum, each of the following elements:

A) Informed Consent and Confidentiality:

Before data collection of MEK data takes place, it is highly recommended that the Consultant first secure informed consent with the Mi'kmaq Participant. Two key elements to informed consent involve education and agreement. The Consultant should ensure that the interviewee is provided

information and demonstrate a clear understanding of the following:

1) Education:

- proposed project specifics
- purpose of an MEKS
- use of MEKS data in the approval process(s)
- the MEKS is not intended to be Consultation for the purpose of justifying an infringement on Aboriginal and Treaty rights

2) Agreement:

- that participation is voluntary
- written Consent and Release form is explained and completed

B) Project Scoping:

The collection of MEK data is based on the concept of Netukulimk. When determining the study area, the Consultant should take into account the nature of MEK data which demands the inclusion of the following:

- MEK data is project and time specific and as such will require recent and updated MEK data
- collection of MEKS data within a buffer area may be considered to be more extensive than the proposed Project footprint
- the collection of Mi'kmaq use and occupation sites and their importance to Netukulimk
- the significance of the inclusion and recognition of Mi'kmaq historical, spiritual and cultural information

C) Developing a Relationship and Interviewing:

This MEKS Protocol does not restrict or define who does a MEKS. However, it does recognize that every Mi'kmaq community has the right to decide whether they should participate with a Consultant on a MEKS. When engaging a Mi'kmaq Participant through an MEKS interview process a number of areas should be considered in terms of developing an approach to the collection of MEK data. At a minimum, these areas should include the following:

- interviews are conducted in the Interviewee's language of preference
- interviews should be conducted at the place of preference to the interviewee

- the interviewer should have appropriate materials including maps and recording devices
- tokens of Appreciation and Gratitude
- the interviewer should be knowledgeable and respectful of Mi'kmaq cultural norms
- the interviewer should take into account "response burden"
- first and second hand accounts should be considered in the collection of MEKS data

D) Sufficiency of MEK data:

It is important that the Consultant ensure that an adequate amount of MEKS data is collected within the proposed study area. The collection of MEK data is dependent on a number of factors. When conducting a MEKS, the Consultant shall make every effort to uncover MEK data from a target group of Mi'kmaq Participants. The target group, at a minimum, must include Mi'kmaq Participants who have specific MEK knowledge or have conducted land use activities in the proposed study area. It is recommended that the Consultant ensure that appropriate time, funding and resources are available to account for the collection of sufficient MEK data. In the event that the Consultant is not able to collect a sufficient amount of MEK data, the reasons or potential causes for this circumstance must be outlined in the MEK Report.

E) Historical Research and Ground Truthing:

The MEKS must include a historical review of Mi'kmaq activity both within and surrounding the proposed study area and an "on the ground" site visit. At a minimum, these activities should include the following:

- historical research from primary and secondary resource materials and oral accounts
- site visits identifying and confirming MEK data
- due regard to safety issues

Phase III - Finalizing the MEKS Report and Disclosure:

This Phase includes all work specific to the analysis of MEK data, reporting and disclosure of MEK information. It is recommended that a MEKS both consider and address, at a minimum, the following two key elements:

A) MEK Data Analysis:

- when reporting MEK data, the Consultants shall use a GIS software program
- when determining the significance of MEK Data the Consultant shall have due regard to both scientific and Mi'kmaq cultural practice and tradition

- the Consultant utilize the following factors when determining the significance of MEK data:
 - the uniqueness and nature of the land or resource use/occupation
 - the cultural use or spiritual meaning of the land or resource use/ occupation
 - the availability and the importance of the land or resource use/ occupation

B) Disclosure and Reporting of MEK Data:

- MEKS Report findings should contain MEK baseline information such as the type of use and species including numbers present
- only MEK of significance be outlined in the report through the use of a GIS
- consideration and due regard should be granted to confidentiality of a Mi'kmaq Participant's MEK data
- the MEKS should provide suggestions on mitigation or remediation of potential impacts in a manner that reflects sound environmental practice from a scientific and Mi'kmaq cultural perspective
- the MEKS Report should be distributed in a timely manner to the Mi'kmaq political organizations as outlined in Appendix C
- the MEKS Report must account for the explicit reservation and protection of Intellectual Property Rights that the Mi'kmaq individually and collectively enjoy in Nova Scotia
- the Consultant shall make explicit reference in the MEKS Report that it is not intended nor is it to be interpreted as constituting Consultation for the purpose of justifying an infringement on the existing Aboriginal and Treaty rights of the Mi'kmaq in Nova Scotia

Section V – Amendments

6.1 This MEKS Protocol can be amended at any time by resolution through majority vote at a duly convened Assembly meeting.

6.2 In the event that an amendment is made to this MEKS Protocol, the said amendment shall be recorded in the Assembly minutes and a copy of the motion shall be attached to the MEKS Protocol as an Appendix.

Section VI – Appendices

See Attached

APPENDIX A

ASSEMBLY OF NOVA SCOTIA MI'KMAQ CHIEFS

Resolution Respecting: A Mi'kmaq Protocol on Mi'kmaq Ecological Knowledge Studies in Nova Scotia

Whereas the Assembly of Nova Scotia Mi'kmaq Chiefs (hereinafter the "Assembly") exists as an institution of governance for the Mi'kmaq of Nova Scotia in respect of issues of common interests and concerns;

And Whereas the Assembly is, in part, responsible to communicate to Canada and Nova Scotia the common position of the Mi'kmaq of Nova Scotia on matters of concern to all the Mi'kmaq people in Nova Scotia;

And Whereas the Assembly, by motion at a duly convened meeting on January 25th 2007, have identified the need to undertake a Mi'kmaq Protocol specific to the design, development and implementation of Mi'kmaq Ecological Knowledge Studies (MEKS) within the province of Nova Scotia;

And Whereas the overall objective of the Protocol is to set up standards and understandings on items that the Assembly considers to be proper MEKS in Nova Scotia;

And Whereas for said purpose, the Assembly has mandated the composition of a committee of technical representatives from the various Mi'kmaq organizations throughout Nova Scotia;

And Whereas the technical committee has jointly developed the attached MEKS Protocol for consideration and approval by the Assembly;

Now Therefore The Assembly Resolves That:

The attached MEKS Protocol is formally adopted by the Assembly of Nova Scotia Mi'kmaq Chiefs.

Passed at Old Orchard Inn, Wolfville, Nova Scotia, this 22nd, day of November, 2007.

Moved By: Chief Wilbert Marshall, Chapel Island (Potloteck) First Nation

Seconded By: Councilor Ian Knockwood, Proxy, Shubenacadie (Indian Brook) First Nation

Decision: Carried by Consensus.

Erik Zscheile, Legal Advisor, Confederacy of Mainland Mi'kmaq

Nike' wla Nipniku's 11, 2000 na elkitmi'tij Eskinuapimk ta'n kisutaq Sante' Mawio'mi wjit Mi'kmaq. Wla nike' ninen ewikasultiek kisi-te'tmek tlwisin "Ethics" Eskinuapimk weja'tekemk na tlwi'tisnen "Ethics" Eskinuapimk.

A Mi'kmaq Ethics Committee has been appointed by the Sante' Mawio'mi (Grand Council) to establish a set of principles and protocols that will protect the integrity and cultural knowledge of the Mi'kmaw people. These principles and protocols are intended to guide research and studies in a manner that will guarantee that the right of ownership rests with the various Mi'kmaw communities. These principles and protocols will guarantee only the highest standards of research. Interpretation and conclusions drawn from the research will be subject to approval to ensure accuracy and cultural sensitivity.

At Chapel Island on July 25, 1999, the Sante' Mawio'mi established a committee to study and develop principles and guidelines to protect Mi'kmaq people and their knowledge. The committee studied the issues involved in research among Indigenous peoples, and developed a set of standards so that Mi'kmaq people might be informed of research - its benefits and costs, be treated fairly and ethically in their participation in any research, and have an opportunity to benefit and gain from any research conducted among them. These principles and guidelines are now being disseminated broadly to each of the Mi'kmaw communities for their review, discussion, and ratification.

[Note: The author of this document is the Mi'kmaw Ethics Watch.]

Principles

Mi'kmaq people are the guardians and interpreters of their culture and knowledge system - past, present, and future.

Mi'kmaw knowledge, culture, and arts, are inextricably connected with their traditional lands, districts, and territories.

Mi'kmaq people have the right and obligation to exercise control to protect their cultural and intellectual properties and knowledge.

Mi'kmaw knowledge is collectively owned, discovered, used, and taught and so also must be collectively guarded by appropriate delegated or appointed collective(s) who will oversee these guidelines and process research proposals.

Each community shall have knowledge and control over their own community knowledge and shall negotiate locally respecting levels of authority.

Mi'kmaw knowledge may have traditional owners involving individuals, families, clans, associations, and societies which must be determined in accordance with these peoples' own customs, laws, and procedures.

Any research, study, or inquiry into collective Mi'kmaw knowledge, culture, arts, or spirituality which involves partnerships in research shall be reviewed by the Mi'kmaw Ethics Watch. (Partnerships shall include any of the following: researchers, members of a research team, research subjects, sources of information, users of completed research, clients, funders, or license holders.)

The Sante' Mawio'mi is the authorized body of the Mi'kmaq people and thus has to delegate authority as to how the Watch is composed.

All research, study, or inquiry into Mi'kmaw knowledge, culture, and traditions involving any research partners belongs to the community and must be returned to that community.

The Mi'kmaq Ethics Watch (Committee, etc.) shall conduct a fair and timely review of all research conducted among Mi'kmaq people and shall maintain control over all research processes.

Obligations and Protocols

For researchers/students/agencies/organizations/corporations conducting research involving Mi'kmaq people and whose research/inquiry enters the public domain (theses, dissertations, published journals, books, technical reports):

All research on the Mi'kmaq is to be approached as a negotiated partnership, taking into account all

the interests of those who live in the community(ies). Participants shall be recognized and treated as equals in the research process instead of as "informants" or "subjects".

All research partners must show respect for language, traditions, standards of the communities, and for the highest standards of scholarly research.

All research scholars shall assume responsibility to learn the protocols and traditions of the local people with whom they do research and to be knowledgeable and sensitive to cultural practices and issues that ensure respect and accommodation to local norms.

All research partners shall provide descriptions of research processes in the participant's own language (written and oral) which shall include detailed explanations of the usefulness of the study, potential benefits and possible harmful effects on individuals, groups and the environment. Researchers must clearly identify sponsors, purposes of the research, sources of financial support and investigators for the research (scholarly and corporate), tasks to be performed, information requested from Mi'kmaq people, participatory research processes, the publication plans for the results, and anticipated royalties for the research. All consent disclosures shall be written in both Mi'kmaq and English, depending on the community norms. No coercion, constraint, or undue inducements shall be used to obtain consent. All individuals and communities have the right to decline or withdraw from participating at any time without penalties.

All research involving children (under the age of 14) or information obtained about personal histories of children will involve informed consent of parents or guardians.

All research partners shall inform participants in their own language about the use of data gathering devices - tape, video recordings, photos, physiological measurements, and how this data will be used. They shall also provide information on the anonymity or confidentiality of their participation, and if not possible, to inform the participant that anonymity is not possible. Participants shall be informed of possible consequences of their choice to remain in the research and their right to withdraw consent or participation in the research at any time.

All research partners shall provide each person or partner involved in the research with information regarding the anticipated risks involved in their participation, and any anticipated benefits.

All research partners must be duly informed of each research step along the way and be provided with information about the research process and the distribution of results and information.

All research partners should attempt to impart new skills into the community, e.g. data collection, whenever possible, advisable or desirable by the community.

All research scholars shall invite Mi'kmaq participation in the interpretation and/or review of any conclusions drawn from the research to ensure accuracy and sensitivity of interpretation.

All research scholars should consider a variety of research processes, including qualitative and participatory research methods and move beyond the dominant quantitative methods to empower indigenous voices and skills.

Mi'kmawey L'nui Skmaq (Obligations for Mi'kmaq Ethics Watch)

These principles have been initiated by the Sante' Mawio'mi:

The Mi'kmaq Ethics Watch shall come from local community representatives authorized to review ethic principles, standards, protocols, practices of research conducted, knowledge, and heritage.

Each community shall decide levels of authority locally, and who shall speak for the community.

Members of the Watch shall work collaboratively to avoid misuse of information supplied by individuals without permission of the community.

The Mi'kmaq Ethics Watch shall operate on the basis of self-determination of each community and consider the risks and benefits of research and the rights of individuals and collectives to be recognized and protected.

The Mi'kmaq Ethics Watch shall consider the credentials and intentions of each research project, its sensitivity to Mi'kmaq culture and heritage, and consider how the research can benefit the community.

The Mi'kmaq Ethics Watch shall consider problems surrounding the purchase or publication of private materials and removal of artifacts. Private papers, photographs, or artistic productions are protected under copyright. One cannot legally cite, reproduce, publish, refer to, or distribute, documents without permission, from the authors, heirs, or institutions that hold copyright.

Any research involving the collection of human genes, Mi'kmaq genetic material, or involving the Human Genome Diversity Project shall be rejected or considered only as to its benefits to the Mi'kmaq people.

The Mi'kmaq Ethics Watch shall increase efforts to educate each community and its individuals to the issues, concerns, benefits, and risks of research involving Mi'kmaq people, heritage, environment, and promote ethical conduct and conformity concerning protocols and guidelines for doing research in and about Indigenous peoples with some kind of disciplinary action against those who do not

comply.

The Mi'kmaq Ethics Watch shall consider the context of the research being requested and the issues of power and control that influence research topics, questions, and results.

The Mi'kmaq Ethics Watch shall encourage researchers to consult with and interpret the research from the tribal perspective and to make research and results available to Mi'kmaq people in their own language(s) and/or orthographies.

Applications to Conduct Research

Shall include:

1. Name of researcher(s) and/or supervisor(s) and related department(s). Name of contact person(s) and contact address (indicate summer addresses if pertinent).
2. Anticipated start date of the research study and expected completion date. Include anticipated field research dates.
3. Title of study.
4. Abstract (100-250 words), giving a brief statement of the hypotheses (or brief statement of research questions and significant proposed research) to be examined.
5. Funding source: indicate the source of research or study funds, and whether grant funds have already been provided.
6. Participants: describe the procedures for recruiting, selecting, and assigning participants.
7. Consent: describe the process by which participants consent to participate in the research project; that is, how will participants be informed of their rights as participants, and by what means they will signify their understanding of those rights and consent to participate. Any research involving children shall require parental informed consent.
8. Language: describe how language and cultural differences of Mi'kmaq people will be accommodated in communicating or deriving consent. Describe process for determining and using appropriate protocols and traditions for entering into Mi'kmaq territories and homes.
9. Methods/Procedures: indicate if any aspects of the study involve risk to the participants or to the Mi'kmaq people collectively. Describe any risk to the person/persons as a result of the findings being

reported or published.

10. Risk or deception: indicate if any aspects of the study involve risk to the participants or to the Mi'kmaq people collectively. Describe any risk to the person/persons as a result of the findings being reported or published.

11. Usefulness and Benefits: describe any benefit(s) for the individual Mi'kmaq person or to the Mi'kmaq Nation as a whole as a result of this study or its published report or findings.

12. Interpretation of Results: explain how the data will be analyzed and whether any Mi'kmaq people will be involved in, consulted with, or informed about, the interpretation process of analyzing the data or the presentation of its findings and conclusions.

13. Storage of data: detail how the data will be stored to ensure safety and confidentiality of the participants in the study. How long will the data be kept? Will the data be used again in another aspect of the study? Will the participants have the right to consent to this next phase of the study?

14. Confidentiality: describe what measures will be taken to protect Mi'kmaq participants and third party privacy (confidentiality and anonymity).

15. Publication and royalties: describe anticipated publications or plans for publication from this research and how any royalties from book sales will be shared with the participants of the study.

Cultural Aspects Review

APPENDIX 4

**ERDENE RESOURCES DEVELOPMENT CORPORATION
BLACK POINT QUARRRY PROJECT
CULTURAL ASPECTS REVIEW**

NOVEMBER 30, 2011

Submitted by:

Roger J. Lewis, M.A. (Archaeologist/Ethnologist)
44-4 Rose Street
Dartmouth, Nova Scotia
B3A 2T6

email: nsarchaeologist@hotmail.com
Tel: 1-902-440-3263

1.0 INTRODUCTION

On November 14, 2011, Roger J. Lewis, MA (Consultant) was contracted by Mi'kma'ki All Points Services (MAPS) to prepare a Cultural Aspect Review of known and potential Mi'kmaq Cultural Heritage Resources in Guysborough County, Nova Scotia in response to the development of the proposed Black Point Aggregate Quarry.

This review is to be adjunct to a more comprehensive M'kmaq Ecological Knowledge Study (MEKS) undertaken by MAPS, and highlights existing source materials from which an opinion of the following topics can be formed:

- 1) Known Mi'kmaq cultural heritage resources in and surrounding the proposed Black Point Quarry development area.
- 2) It outlines special and/or significant characteristics of those cultural heritage resources.
- 3) It addresses the relationship between known cultural heritage resources and past Mi'kmaq land and resource use patterns in the area.
- 4) It considers the limitations of current archaeological research within and surrounding the proposed development area and offers an opinion of the potential existence of unidentified cultural heritage resources.

2.0 PURPOSE OF CULTURAL ASPECTS REVIEWS

Cultural Aspects Reviews set the context for understanding existing and potential cultural heritage resources. They are also utilized to provide information and recommendations which will allow decisions to be made by project proponents and other interested parties to protect cultural heritage resources which may be impacted by accidental disturbance in a development area.

3.0 DEVELOPMENT AREA

The proposed Black Point Aggregate Quarry is situated on a 250 hectare (ha) property located along the southern rim of the Chedabucto Bay approximately 10 kilometres (km) west of the Town of Canso. It falls within a traditional land and resource use area known to Mi'kmaq as *Eskikewas'kik* or 'Skin Drying Area'. Here the cooler waters of the Labrador Current meet the warmer waters of the Gulf Stream and was base of one of the most lucrative fishery initiatives ever undertaken in the New World.

4.0 MI'KMAQ CULTURAL HERITAGE RESOURCES

Nineteen (19) Mi'kmaq cultural heritage resource sites have been identified in Guysborough County to date, but none in the immediate vicinity of Black Point (see Figure 1.). Thrity-six (36) Mi'kmaq cultural heritage sites have been identified in neighbouring Antigonish County, with 93 Mi'kmaq heritage sites found in Halifax County (NSM 2011 – MARI). The temporal period of sites located in these counties range from Mu Awsami Kejikawe'k L'nuk to Kiskuke'k L'Nuk (Archaic to present) (Lewis 2006).

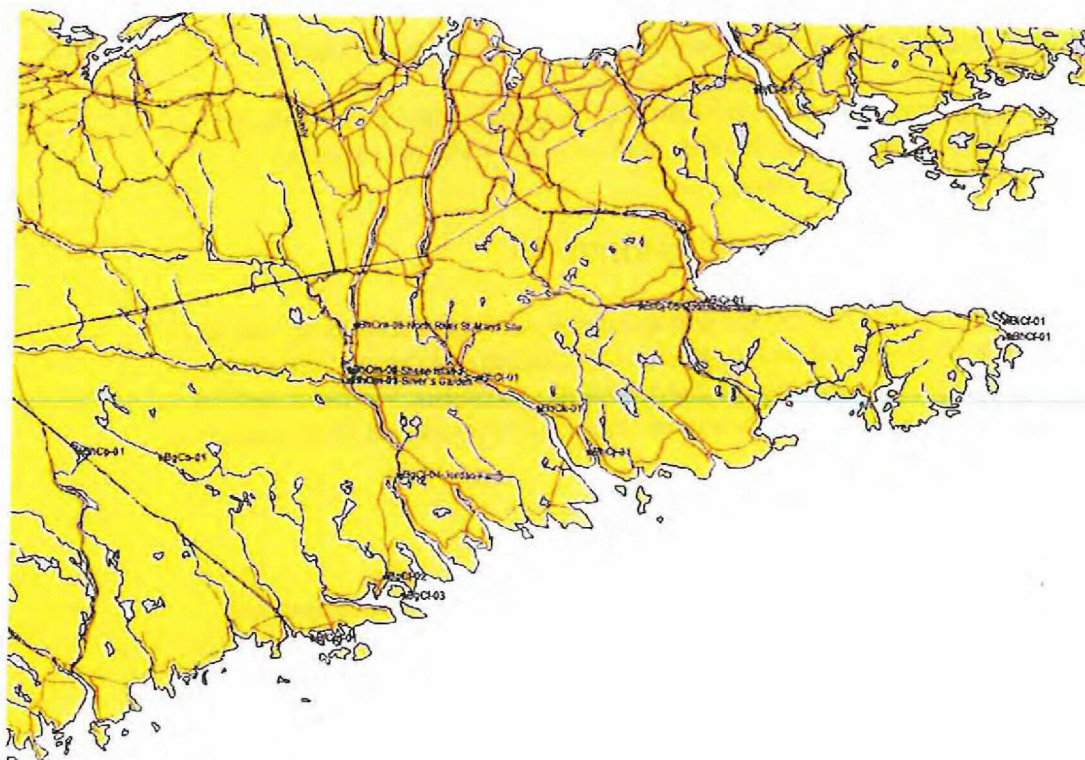

Figure 1: Mi'kmaq Cultural Heritage Resources – Maritime Archaeological Resource Inventory 2011

Table 1, provides a summary of Mi'kmaq Cultural Heritage Resource in Guysborough County, Nova Scotia

Site	County	Type	Temporal Period	Years
BfCm-1	Guysborough	Resource	Kejikawe'k L'nuk - (Recent People)	2500- 500
BgCo-1	Guysborough	Burial	Kiskukewe'k L'nuk (Todays People)	500 - present
BgCi-2	Guysborough	Resource	Kejikawe'k L'nuk - (Recent People)	2500- 500
BgCi-3	Guysborough	Burial	Kiskukewe'k L'nuk (Todays People)	500 - present
BgCi-4	Guysborough	Resource	Unknown - destroyed	
BhCf-1	Guysborough	Resource	Unknown - but recorded by Harry Piers, NSM (1900's)	
BhCj-1	Guysborough	Resource	Kejikawe'k L'nuk - (Recent People)	2500- 500
BhCk-1	Guysborough	Burial	Unknown - but recorded by Harry Piers (NSM)	
BhCi-1	Guysborough	Burial	Unknown - GSC Maps annotated by Harry Piers, NSM (1900's)	
BhCm-1	Guysborough	Resource	Kejikawe'k L'nuk - (Recent People) - Harry Piers Notes (1900's)	2500- 500
BhCm-2	Guysborough	Burial	Unknown - GSC Maps annotated by Harry Piers Notes (1900's)	
BhCm-3	Guysborough	Resource	Kejikawe'k L'nuk -(Recent People) - Harry Piers Notes, NSM (1900's)	2500- 500
BhCm-4	Guysborough	Unknown	Unknown - Unfinished pipe bowl (Harry Piers Notes 1900's)	
BhCm-6	Guysborough	Resource	Kejikawe'k L'nuk - (Recent People) - Harry Piers Notes (1900's)	2500- 500
BhCp-1	Guysborough	Burial	Kiskukewe'k L'nuk	500 - present

			(Today's People) - Matteo Salome buried wife here.	
BiCf-1	Guysborough	Resource	Unknown – Recorded by Harry Piers	
BiCi -1	Guysborough	Burial	Kiskukewe'k L'nuk (Today's People)	500 - present
BiCi-2	Guysborough	Gathering	Mu Awsami Kejikawe'k L'nuk - Kejikawe'k L'nuk (Not So Recent People - Recent People)	10,000 - 500

Table 2, further explains: Ta'n Telo'ltipni'k L'nuk Mi'kma'kik (How the People Live in Mi'kma'ki).

Temporal Period	Radio Carbon Years	Calendar Years
Sa'qewe'k L'nuk (Ancient People—Palaeo Period)	11,500 – 8,500 BP	13,500 – 10,000
Mu Awsami Kejikawe'k L'nuk (Not so Recent People—Archaic Period)	8,500 – 3,000 BP	10,000 – 2500
Kejikawe'k L'nuk (Recent People—Woodland Period & early European contact era traditions)	3,000 – 300	2500 - 500
Kiskukewe'k L'nuk (Today's People—early European contact and colonial era traditions)	1,000 – present	500 – present

Table 2: Mi'kmaw terms from Roger Lewis (2006).

5.0 LIMITATIONS OF ARCHAEOLOGICAL RESEARCH

The archaeological narrative for Guysborough County is incomplete. Scattered surface finds and map annotations provide much of the fragmented archaeological story for the county. Mi'kmaq land and resource patterns in Guysborough County, Nova Scotia would be analogous to other areas Nova Scotia, but to date this has never been sufficiently investigated.

Factors influencing Mi'kmaq land and resource in Guysborough County include physiographic features such as climate, physical landscape, and ecological landscape. The primary attraction of the county being its five (5) principal rivers (St. Mary's, Country Harbour River, New Harbour-Salmon, Isaac Harbour River, and Milford Haven River), associated estuaries, a myriad of interior lakes and supporting boundary habitat which constitute critical land and resource use areas (Lewis 2006, 2009).

6.0 CULTURAL HERITAGE VALUE

The overall cultural heritage value of existing and the potential to identify similar sites within Guysborough County would be significant considering the proximity of the development area to principal rivers/estuaries, interior lakes, associated boundary habitats and other known Mi'kmaq cultural heritage sites.

7.0 CONCLUSION

Based upon an archaeological interpretation of the existing record it is reasonable to conclude that there has been a continuous Mi'kmaq presence in the county which spans from *Mu Awsami Kejikawe'k L'nu* (Not so Recent People -Archaic period -10,000 – 3,000 BP) to *Kiskukewe'k L'nuk* (Today's People - 1,000 – present).

It is also reasonable to conclude that lands set aside for development could be viewed as areas of 'medium - high' potential for past Mi'kmaq land and resource use. The absence

of sites in the development area is not suggestive of a lack of Mi'kmaq presence but more a wanting of archaeological research. The existing archaeological narrative and evidence should not be used in isolation to determine cultural heritage value. It is subsequently recommended that prior any disturbance of the proposed Black Point Aggregate Quarry a pedestrian or surface survey be undertaken.

Introduction

Historical records were canvassed from National Archives of Canada, Nova Scotia Archives, TARR Centre Archives, The Nova Scotia Museum, internet sources and secondary source print material. It is important to note the limitations of research. Since Mi'kmaq history tends to be an oral history rather than a written history, it is sometimes difficult to put forward a complete history from documented sources as some history may be missing or not available. The following quote by H.C. Hart (1975) makes note of historical events not being recorded:

"There are no traces of French occupation here, and no written record of ancient events, but if one could understand the mysterious voices of nature, could know what the winds whisper to the hemlocks, could interpret the wild song Old Boreas sings to Mount Stor through many a long winter's night; if the old legends the waters tell to rock, and beach, and headland could find a hearing in man's dull ears; if the histories of races as well as the convulsions of the earth could be penetrated and made manifest by the geologist, then there would be revealed many a gathering of red braves around the council fire, many a stirring recital of prowess in hunting and skill in fishing; aye, and many a fearful tale of attacks upon the white man in distant settlements, planned here and celebrated here with feasts and rejoicing on their return".¹

Mi'kmaw Communities

There are two Mi'kmaq First Nations nearest the project site: Paqtnkek First Nation and Potlotek First Nation. The registered population as of December 2011 for Paqtnkek First Nation is 540 persons. Paqtnkek Reserve lands consist of the Simon Property (24 kilometers East of Antigonish), Pomquet-Afton #23 (24 kilometers East of Antigonish), 48% of Franklin Manor #22 (32 kilometers southwest of Amherst) and Summerside #38 (18 kilometers East of Antigonish).² The registered population as of August 2012 for Potlotek First Nation is 691 persons.³ Potlotek Reserve lands consist of Chapel Island IR #5 (69 kilometers southwest of Sydney) and Malagawatch IR #4 (62 kilometers southwest of Sydney).⁴

Chronology of Historical Events

The project area is located within the District Esigeoagig, the skin dressers' territory.⁵ Within this district Hoffman notes that there are seven important sites where settlements were or may have been located. One of these sites is Gamsog - Canso meaning "rock on the other side". A second, Notogetetoalneg, located at the mouth of Salmon River which empties into Setapogtog (Chedabucto Bay), meaning "running far back". A third site, Oalamgoaganeg (Port Mulgrave) is at the entrance to the Gut/Strait of Canso.⁶ Notogetetoalneg is known to be a summer village from historical sources as Hoffman states:

"...Chedabucto Bay was an important fishing station at a very early date, and that a Capuchin mission was already established there by 1634 – from which we may conclude that a relatively permanent Indian village must have been situated in the vicinity. Native tradition places such a village at the mouth of the Salmon River, and gives it the name indicated".⁷ Oalamgoaganeg is noted as being very important for the Micmac by Deny as Hoffman quotes "...those vessels which are going into the Great Bay of Saint Laurens to make their fishery, and which arrive on the coast at a very early time and are not able to enter into the Grand Bay of Saint Laurens by the Grand Passage [Cabot Strait] because of the ice-fields, come to seek this Little Passage, and place themselves at ancor in this cove to let the ice pass by...I have seen as many as eight or ten vessels, and although the current was extremely strong in this Little Passage, the ice did not inconvenience the vessels at this place..."⁸

Jost writes of the Micmac to be "A group of people so nomadic in their habits would not be long in establishing for themselves a number of well known travel routes, and one of the best known of these, on the trunk roads, extended almost the entire length of Guysborough County".⁹

John Reid writes that people had been in the Maritime Provinces "continuously for more than 10,000 years and the direct ancestors of the Micmac and Maliseet-Passamaquoddy Indian peoples had been established since about 1000 BC. Since then their culture had altered and evolved. Among the periods of most significant change was the century following the first European contacts in or about the year 1500".¹⁰

In 1518, Baron le Lery left cattle at Canso before sailing back to France.¹¹

In 1607 Marc Lescarbot reports that he met Captain Savalet of Saint-Jean-de-Luz on a voyage from Port Royal to France. Savalet was making his forty-second voyage to Canso, Nova Scotia where he worked in the dry fishery.¹²

A 1607 letter brought to Port Royal from Canso onboard a supply ship informed the French that Indian graves had been opened by the Dutch and beaver skins were taken from the dead. The Indians of Canso had killed the person who shown the location of the graves.¹³

In 1609 Henry Hudson entered Canso to repair his ship and was received kindly by the Indians and an Indian village existed.¹⁴

In 1650, Nicholas Denys and his brother Simon worked on two forts in Cape Breton (St. Peters and St. Ann's). After a year their forts and ship were seized by the authority of Madame Aulnay and taken to Port Royal. Latour intervened and had their properties returned to them. Nicholas returned to Cape Breton and later again his fort was seized. In exchange for a large sum of money Denys secured a large tract between Canso and Cape Roziers, including Cape Breton and Ile St. Jean. Within six years, two settlements were established with eighty families. At Chedabucto Denys built another fort and trading post.¹⁵

In the early 1680's Fort Saint Louis was built in Guysborough. It was captured in 1690 by Sir William Phips.

In 1686, France made a large grant of land to the Sedentary Fishery Company of Acadia. This company consisted of La Rochelle merchants and they were to enjoy the fishing monopoly at Chedabucto and Canso. In 1702, New England seized the company's vessels and attached its fishing ports.¹⁶

New England fishermen were interested in Acadia and since the 1620's they were fishing and drying their catch along the shores. Before the start of the Anglo-French wars in 1689 the Acadians and Mi'kmaq tolerated the fishermen's presence. Fishermen were attacked by French naval forces and by Mi'kmaq warriors in the coastal waters and on land. Fishing activity declined greatly during the wars.¹⁷

In 1621, Sir William Alexander was granted land by King James for "New Scotland". In 1629 his colony was captured and Captain Charles Daniel built a trading post at Chedabucto and was later relinquished to Isaac de Razilly. After de Razilly's death it passed to Nicholas Denys. Denys was a French fur-trader, merchant and settler. Denys traded with the Mi'kmaq for furs. He employed up to 120 men and cleared 20 acres for crops. After 1682, Sieur Bergier, a Huguenot merchant from La Rochelle, added a

chapel to honour St. Louis, patron saint of Chedabucto, and increased agriculture development. A sawmill and homes were constructed. In 1688 Chedabucto was captured and looted by English pirates from Boston.¹⁸

In 1642 Catholic Mission was established at Canso and is known as St. Anne's parish today.¹⁹

In 1654 Frenchman La Giraudiere had lived what is present day Sherbrooke. He was devoted to the fishery and fur trade. He *"supplied the Indians with nets and spears for the salmon fishery, in the river, and in the Glenelg Lakes"*.²⁰

In 1654 La Giraudiere, a Frenchman, had a trading post and resided at St. Mary's for many years, devoted to fish and fur trade. The French supplied the Indians with spears and nets for the salmon fishery in St. Mary's river and Glenelg Lakes. In 1669 La Giraudiere's fort was taken by the English.²¹ In the Spring of 1856, twenty-two bears were killed in Caledonia (west branch of St. Mary's River) showing this area was a great resort to the Micmac.²²

In 1657 Father Maitre de Lyonne established mission at Chedabucto and it existed for 30 years.²³

In 1659 Campseaux (Canso) Harbour has abundances of cod, mackerel and herring.²⁴ Salmon River has an abundance of large salmon with the smallest being three feet long.²⁵

Father Andre Richard, Missionary, returns to France in 1662 and Nicholas Denys write to him requesting the return of missionaries for the Indians. The Mission in Chedabucto became the longest established mission. The Canso tribe of Indians travelled between Chedabucto and Afton. They stayed at Chedabucto during spring, summer and fall and spent winters mostly in Afton. The route between Chedabucto and Afton is known as Roman Valley.²⁶

In 1684 La Valliere robbed an Indian Nigascouet while he was on his way to Chedabucto of 70 moose skins, 60 martins, 4 beaver and 2 otter.²⁷ There was a Micmac village one mile west of Fort St. Louis.²⁸

In the year 1687-1688, Chedabucto flourished with 51 inhabitants and 52 Indians. "*Canceau was a small Indian station*".²⁹

On August 9, 1701 Nehemish Jewette, Speaker, writes to his Majesty regarding complaints of spoil of wood by cutting and using trees for private use. Fortification with garrison at Canso Bay "*fifty miles to ye Easter [ards] of any settlement of the English whereby we designed to accomodate the Indians for — and to supply them at easie rates tho with loss to the Plantation to prevent their going to the French therefore, and to fix them in the English interests, as also to encourage the settlement of [that]/part of the Province, And a Plantation will be speedily set forward there in case a new War does not commence*".³⁰

December 27, 1701 At a council chambers in Boston, a meeting with the Eastern Indians regarding the war between English and French. In order to prevent any wrongdoing it is advised that the Indians bring an English man along to the trading post in Casco so that they are not mistaken by the English for French Indians. Indians state that "*Our lands goes as far as Penicook and St. John's, we want our Lands to hunt on*".³¹

The Treaty of Utrecht, drafted in 1713, was interpreted differently by the French and English with respect to Canso. French held sovereignty over the islands and Great Britain held the mainland. Canso was an island and it also was close to the shore of the mainland. In 1719, ten British fishing vessels were lost to French privateers and fighting continues for the year making Canso inhospitable.

In 1717 Father Gaulin set up a mission in Afton where the Canso Mi'kmaq had a winter settlement which was just across from the Gut of Canso. In 1718 Father Gaulin went to Paris to lobby for the Acadian-Mi'kmaw claim to the fishery at Canso.³²

On October 31, 1718 Indians drive English fishermen away from fishing in Cape Canso.³³

Basques and other Frenchmen have dried fish in Canso since the early seventeenth century. Fishermen and privateers from rival empires had on occasion fought over Canso among themselves but in 1718, Governor of Nova Scotia Richard Philipps notified the British ministry who protested to France and New Englanders took action. In September 1718 frigate *Squirrel* was sent from Massachusetts to Canso. The Commander of the *Squirrel* ordered the French to leave, which they refused. The Commander seized two fishing vessels and escorted them to Boston.³⁴

In a letter dated April 29, 1719 John Doucett to Col. Phillips writes that Captain Chadder:

*"went to Canso to pacify ye savages who threatened the English, but never takes notice to me that he warned the English from Fishing any more there; to which Several in New England have made Oath.....happ you will apply to the Lords of Trade for Presents for the Indians, who are already incensed against Us, by not taking notice of them, and since the beliefs being taken at Canso, the French underhand Exasperate them, to thot I fear our Fishery will suffer this year without a Man of War to protect them, or Forts on the Coast".*³⁵

In August of 1720, Governor Philipps responded by erecting a fort at the Canso Islands and for the next twenty years the British enjoyed the fishery at Canso.³⁶ The fort persuaded the French to stay away but Mi'kmaq warriors continued to resist for the next four years. On one occasion New England fishermen battled with Mi'kmaq warriors in captured ships. Bombs were tossed into the Mi'kmaq's ships and when they swam to shore they were fired upon, killing twenty-two men. The bodies were decapitated and set on spikes near Canso's fort.³⁷

In 1720, Gov Phillips stationed troops at Canso as it had become *"by far the most important commercial centre in Nova Scotia"*.³⁸ Canso was the rendezvous point for the attack on Louisbourg.³⁹

In early 1725 the Micmac attacked Canso destroying two houses and killed 6 civilians. In June, Indians were reported to be seizing fishing boats along the Atlantic coast. Governor Lawrence Armstrong proposed a tour of the province the following spring to force the oath of allegiance. Armstrong hired 36 men with 3 whale boats to terrorize the Micmac around the fishing areas. However, on December 15 articles of peace were concluded and the treaty was ratified in June 1726.⁴⁰

Canso was seized by the French in 1744.⁴¹

The October 1, 1749 council meeting was related to recent hostilities in Canso by Indians. Indians want to declare war as they believe they are free people. Orders were given to all within the province to *"annoy, distress and destroy the Indians every where"* and that 10 Guineas for "every Micmac killed or taken prisoner".⁴²

A council meeting on October 8, 1749, was held aboard the *Beaufort* regarding recent hostilities at Canso with the Indians. Edward Cornwallis:

"gave orders to the Commanding Officers at Annapolis Royal, Minas & all others within the Province, to annoy, distress & destroy the Indians every where" and that "a Premium be promised of ten guineas for every Indian killed or taken prisoner".⁴³

"The crucial period of vigorous Micmac resistance lies between 1749, when Cornwallis placed the bounty of Micmac scalps, and 1763, when a comprehensive treaty was signed between Micmacs and colonists. During this period the Micmac attacked the English repeatedly, at Chignecto, Canso, Chebucto, Dartmouth, Lunenburg and Halifax. The British attempt to expand settlement in Nova Scotia was severely impeded by Micmac resistance".⁴⁴

On August 10, 1752 Governor Hopson informs His Excellency that on August 4th two English schooners, the *Friendship* and the *Dolphin*, were fishing near the Isle of Canso and were seized and taken by the Indians. Governor Hopson wishes to use authority to release the twenty men and a canoe that were seized.⁴⁵

August 30, 1752 In response to Governor Hopson, His Excellency is making the return of all prisoners seized and notes that the Indians *"didn't even ask a ransom for their return"*. There is mention of a third schooner that was also taken, the *Halifax*, by the Indians.⁴⁶

June 14, 1754 Sworn before the Governor in Council, Thomas Walker testifies that he was in Louisbourg in September 1753 and met an Indian who told him Father Le Loutre paid the Indians one hundred Livres for every English scalp and one hundred fifty Livres to an English officer's scalp. The Indian told Walker that Canso belonged to them.⁴⁷

Aug 27, 1754 LeLoutre wrote to Governor Lawrence proposing that all territory in the eastern part of Nova Scotia (Cumberland, Colchester, Pictou, Antigonish and Guysborough Counties) should be ceded in perpetuity to the Micmacs.⁴⁸

In 1759 Major Robert Elliot, 43rd Regiment, received special assignment to take men to Restiouche on Chaleur Bay. With his mission complete, Elliot presented Acadians and Micmac Leaders gifts of blankets and provisions. On November 5, Elliot sailed through the Gut of Canso into the Atlantic during storm.⁴⁹ By the 15th, they saw land but were not sure of where they were and the schooner ran aground off Sable Island.⁵⁰

Between 1760 and 1764 a vessel belonging to Chedabucto was chased up Chedabucto Bay by a privateer. The first two settlers at Chedabucto bay (Elias and John Cook) made friends with the local Micmac.⁵¹ Messenger Cook came to the aid of the vessel by making a cry of trouble to the Indians. Many Indians came to their aid in canoes and the privateer fled.⁵²

On December 9, 1761 King George III gave instructions to the Nova Scotia Governors to maintain treaties and to respect Indian land rights.⁵³

On May 4, 1775 Franklin writes to the Earl of Dartmouth about his evidence of the actions of Jonathan Binney, Esquire and member of His Majesty's Council. In 1764 Governor Wilmot sent Binney to regulate the fishery and trade at the new fishing settlement at Canso and to "*watch over the motions of the Indians*". With the assistance of a navy gentleman who was near Canso Mr. Binney:

*"Effectually dispersed these Savages, to the very great Satisfaction of Government, for the Indian Was then ensured, the greatest part of our settlements must have been broken up".*⁵⁴

It was reported on September 18, 1781 that provisions were supplied to the Indians in 1779, 1780 and 1781. "*Delivered Indians from Canso by order of Mr. Buckeley*" November 15th 1781 4 yards cloth, 2 blankets, Pipes of Tobacco for a total cost of £2.15.6.⁵⁵

When Guysboro was a new colony (ca. 1783-179?), many canoes arrived near the harbour entrance and 300 Indians landed at Captain Hadley's home. Messengers Cook and Hadley understood the Micmac language and overheard their plan to attack and were able to plan their defense. Before the attack happened a Cape Breton priest had heard of the plan and influenced the Micmac not to attack the English.⁵⁶

Prior to 1784, the Counties of Antigonish and Guysborough were called Sydney County. Sydney County was created in 1784 and the boundaries were:

*"Beginning at the Head of Tide at the Head of St. Mary's River thence to run North by the magnet to the Sea Shore to the West of Cape St. Louis, and bounded on every other part by the Sea Coast and to include all Islands in front of these limits deemed to be in Nova Scotia".*⁵⁷

⁵⁷ Cooke, Findlay History and Stories of Isaac's Harbour and Goldboro, Antigonish: Formac, 1976, (p. 6)

A large number of Micmac canoes (around 1786) came into Chedabucto Bay and proceeded to raid Mr. Nixon's store. Before any further outbreak occurred a Cape Breton priest influenced the Indians to abandon further attack to the settlement.⁵⁸

In December 1796 the Indians of Guysborough received necessary articles of potatoes, herring, gunpowder, shot, flint, lead, baize, blankets, shirts, coats, trousers, jackets (under-vests), blue cloth and flour from Government. It was expected that the Indians be faithful to the King and take up arms on the English side in event of invasion.⁵⁹

Mocodome (Country Harbour) was a favorite encampment for the Micmac.⁶⁰ Indian Harbour is also a favorite encampment. There were once many villages of wigwams in the area as it was an ideal fishing and hunting area that provided all that the Micmac needed.⁶¹ Beyond the beach at Indian Harbour is Indian Harbour Lake where shelter could be found from storms. At high tide large boats could be taken upstream. There is an extensive Micmac burial ground in this area.⁶²

There is record that at Wine Harbour a Portuguese barque loaded with wine wrecked here during a storm. Indians from the adjoining harbour came to seek the spoils of the wreck only to see disaster as several Indians froze to death.⁶³

There are two old Micmac burial grounds with the area of St. Mary's. One is on an island in lower Glenelg Lake and the other north of Sherbrook.⁶⁴

In a 1796 Letter of Sir John Wentworth is authoring Major William Nixon, Manchester, for supplies for the Micmac at the area including potatoes, herring, gun powder, shot, lead, flints, baize, blankets, shirts, coats, trousers, jackets or under vests, blue cloth and flour.⁶⁵

In 1801, Joshua Frost writes to His Excellency Sir John Wentworth stating that seven Indians have complained to him and are "*very much Discommoded*" in their fishing and hunting and the Indians are requesting that five acres of land be granted to them at Salmon River with "*a free Priveledge of fish*".⁶⁶

On May 6, 1801 Smith had no luck trout fishing along St. Mary's River probably because

*"having been so much hunted by Indians formerly, as we saw a multitude of their old winter camps".*⁶⁷

Smith noted that the North Branch of St. Mary's River is ideal for salmon because of the number of summer camps along the lakes.⁶⁸ Smith found about twelve broken salmon spears along the bank of St. Mary's River.⁶⁹

In a letter of William Nixon to Sir John Wentworth dated November 20, 1801 Scottish emigrants bringing small pox, measles and whooping cough to the area and the Indians have left for fear of disease and relocated at the head of Guysboro River. He is requesting relief for 40-50 families.⁷⁰

The Great Gale of 1811 destroyed several ships and much of the community of Canso.⁷¹

In October the great Gale of 1811 took down a white sloop owned by an Indian named Prosper.⁷² The sloop left Fox Island with three to four people aboard when all were lost before the sloop left the harbour.⁷³

In 1819 Thomas Munroe, his family and others came to Whitehaven and built log cabins up the river. Upon exploring the area they came upon Micmac Indians and together they proceeded to Molasses Harbour.⁷⁴

In 1819 women settlers at Whitehaven encountered Indians while their husbands were out fishing. The women were guided to the Indians wigwams then all went onto Molasses Harbour where they were received by a French family. Relations were quickly established with the Indians and settlers.⁷⁵

Country Harbour, called Mocodome by the Micmac, is a favorite camp area with trout, salmon, herring, mackerel and codfish.⁷⁶

Indian Harbour was a favorite resort of the Micmac with fish and it was close to the forest for fowl. There were large numbers of wigwams there.⁷⁷

On the West Branch St. Mary's River near Caledonia and Trafalgar was a "*great resort for Indians on hunting and trapping expeditions*".⁷⁸

⁷⁸ Hart, 1975, (p. 169-170)

Wine Harbour was named so because a Portuguese barque with a cargo of wine wrecked there during a storm. Indians from nearby fled with cargo and some froze to death near the wreck.⁷⁹

In 1836, the boundaries of Sydney County were changed when Guysborough County was established out of the former lower part of Sydney County. In 1914 the Lt. Gov and Council authorized a surveyor to run the boundary line for Guysborough County. Indians from Isaac's Harbour encampments

*"roamed from the Isaac's Harbour interior lakes to the Bay and Country Harbour River as far as the headwater lakes which are: Sinclair, Pringle and Eight Island Lakes near Goshen".*⁸⁰

On February 28, 1838 a Petition was submitted against fishing with large nets in Chedabucto Bay. Fishermen are sewing large nets together and setting them far out in the bay which keeps fish from entering the coves and bay. These nets caused hardship to the inshore commercial fishery and to people who fish for food.⁸¹

On April 6, 1845 a Petition of John Battis, Joseph Battis, Francis Cope was submitted for land in Guysborough County

*"in the neighbourhood of which they have many years sojourned. Each year their hunting ground and subsistence there from are more scanty and precarious".*⁸²

On February 2, 1848 Abraham Gesner, Indian Commissioner, submitted a petition to the House of Assembly which was signed by eleven chiefs and captains of the Mi'kmaq *"to prevent the Hunting of Moose by Dogs and to Secure to Them Their Fisheries"* and to allow them to spear salmon in any of the rivers within the province. White man's hunting style was threatening the moose population as they only took the skin, leaving the rest behind.⁸³

On Feb 19, 1849 Letter seeking relief for Indians. The Committee recommends that £30 be given to the Indian Commissioner at Antigonish for the relief of the Indians in Sydney and Guysborough Counties.⁸⁴

On December 8, 1849 a Petition of Newel Joe, Newel Dennis and others to John Harvey for relief at St. Mary's, Guysborough County. There was crop failure and fish and game are scarce. 200-300 moose were taken by white people last spring in St. Mary's alone. Family names listed are: Joe, Dennis, Grigwell, Lewie, Toney, Cristifer, Glema, Louland, Michal, Potet, Forit, French, Caber, Prosper, and Sabia.⁸⁵

In 1850[?] Chearnley tells a story of a bear given to him by "*an Indians of Great Hunting celebrity who had been dead some years Joseph Glode*". Glode has shot and killed a female bear and found a cub beside it and presented it to Chearnley.⁸⁶

On October 6, 1851 Denny Michael to Joseph Howe Petitioned for relief for Mi'kmaq in Guysborough County, Country ____ (Harbour? or Clam). The Mackerel fishery has failed and white fisherman have no money to purchase their goods.⁸⁷

On April 28, 1856 Stewart Campbell writes to [? Chearnley] for relief for the Indians at McNairs Cove, in the Straight of Canso.⁸⁸

In the Fall 1857 Harry Piers, Stephen Piers, Charles McDonald and Peter Joe wished to participate in "*the mysteries and glories of Moose Calling*" at Lake Mooin, Guysborough County.⁸⁹

A 1863 Petition from Guysborough County regarding unwanted destruction of the moose population was received. No moose hunting should be allowed for three years to allow stock to recover.⁹⁰

On December 2, 1871 James B. Hadley Sr. writes a letter to an unnamed Sir that there are 8 Indian families staying in the woods for the winter near Port Mulgrave. He writes that they are very poor and cannot sell their items. He left them with forty eight blankets.⁹¹

On Aug 23, 1872 Angus Cameron writes to the Honourable Joseph Howe of the Indians being deprived of their burial grounds in St. Marys that they claim for 150 years. The burial is at "*Sheep Island at the Forks or Glenelge Lake*".⁹²

A 1872 Letter to the Honourable Joseph Howe, Secretary of State for the Province from John McKinnon, Indian Agent. The letter refers to the conditions of the Indians in the district of Guysborough. It reports that "*considerably large tracts of land*" have been cultivated and abundant crops of hay, potatoes and oats. He reports that in the summer many Indians fish with but this year was not as successful. Last names of Indians listed: Gabril, Prosper, Joe, Sallome, Pictob, Scotchman, Marble, Batist, Fraser, Marshal, Nicholas, Cope, Lafford, Newl, Tony, Brassay, Meuse, Tom, Phillip, Paul, McKeugir, and McMillan.⁹³

Letter of John McKinnon Jr., Indian Agent to Joseph Howe, Secretary of State for the Province dated May 22, 1872. Reports that there are two or three Indian families in Guisboro who fish every summer at Cape Canso and camp every winter near the Town of Guisboro. Others make home at the Strait of Canso.⁹⁴

The August Gale of 1873 changed the village of Canso.⁹⁵

John Lewis and Harriet Cremo followed their family traditions by making an annual journey from Chapel Island to Canso where they would fish for swordfish along the areas waters. They would stay for several weeks and return to Chapel Island for the annual St. Anne's Mission.⁹⁶

Harry Piers' hand written notes regarding the moose hunt expedition with Micmac guides, including Peter Joe. Moose, black duck, otter and porcupine were hunted near Lake Moooin, Liscomb River and Hunters Lake, Guysborough.⁹⁷

In 1922 the hunting territories within Guysborough included Frank Cope – Hunting Lake, Governor's Lake and Ten Mile Lake (#35); Peter Joe Cope – Fifteen Mile Lake, Rocky Lake (#36); Michael Tom (Toney) – Moser River (#37); Young Peter Joe Cope – Large District North of Sheet Harbour (#38) (p. 103); Mathew Salome – Big Liscomb Lake (#39); Jim Paul – Hunting Lake and Liscomb River (#40); Abram Paul – Lake Moooin, Back of Liscomb (#41); Newell Denis – Country Harbour, Isaacs Harbour and north (#42); Steve Malone – Loon Lake (#43); Peter Anthony – Mill Village River, near Port Mulgrave (#44).⁹⁸

On February 6, 1965 John S. Erskine writes to Mr. G.G. Campbell, Principal, Sydney Academy. Erskine writes to Campbell that John Prosper, late Chief of Bayfield, was born into the Canso band and spent winters at Framboise Cove spearing eels and would come to Canso to fish in the Spring.⁹⁹

Mi'kmaq Place Names in Guysborough County

Mi'kmaq words are different from English words. The main difference is the way the words are put together. A lot of information can be packed into a noun or verb and it can take many English words to properly translate them. Mi'kmaq place names name natural features and also describe geological features. Mi'kmaq place names reveal social and political history within a region.¹³⁵

Place	-	Mi'kmaq Place Name	-	Meaning (if given)
Guysborough County	-	Esigeoagig	-	skin dressing place ¹³⁶
Black Point	-	Magteoatgeg	-	black head
Chedabucto	-	Sedabuktook	-	the deep extending (great) harbour
Cooks Cove	-	Notogtetoalneg	-	small Indian village
Durells Island	-	Siplogagneg	-	
Fox Island	-	Sebelogwokun	-	where skins are stretched
Half Island Cove	-	Aoaganeg	-	portage
Halfway Cove	-	Oetonitjitig	-	
Indian Cove	-	Elnoei gomi	-	
Philips Harbour	-	Pilipgomimg	-	
Fox Island Cove	-	Nasonigetjg	-	rushy

Specific Land Claims

The Confederacy of Mainland Mi'kmaq was contacted and currently there are no outstanding specific claims identified within the project area. However, there is interest in the Dorts Cove area¹³⁷. This in no way infers that specific land claims may not arise in the future.

¹³⁶ Preliminary Historical Research on Mi'kmaq Place-Names in Nova Scotia, Volume II, Report prepared for the Aboriginal Title Project, 2006

¹³⁷ Email communication, Mary Jane Stevens to Jennifer Copage, January 23, 2012.

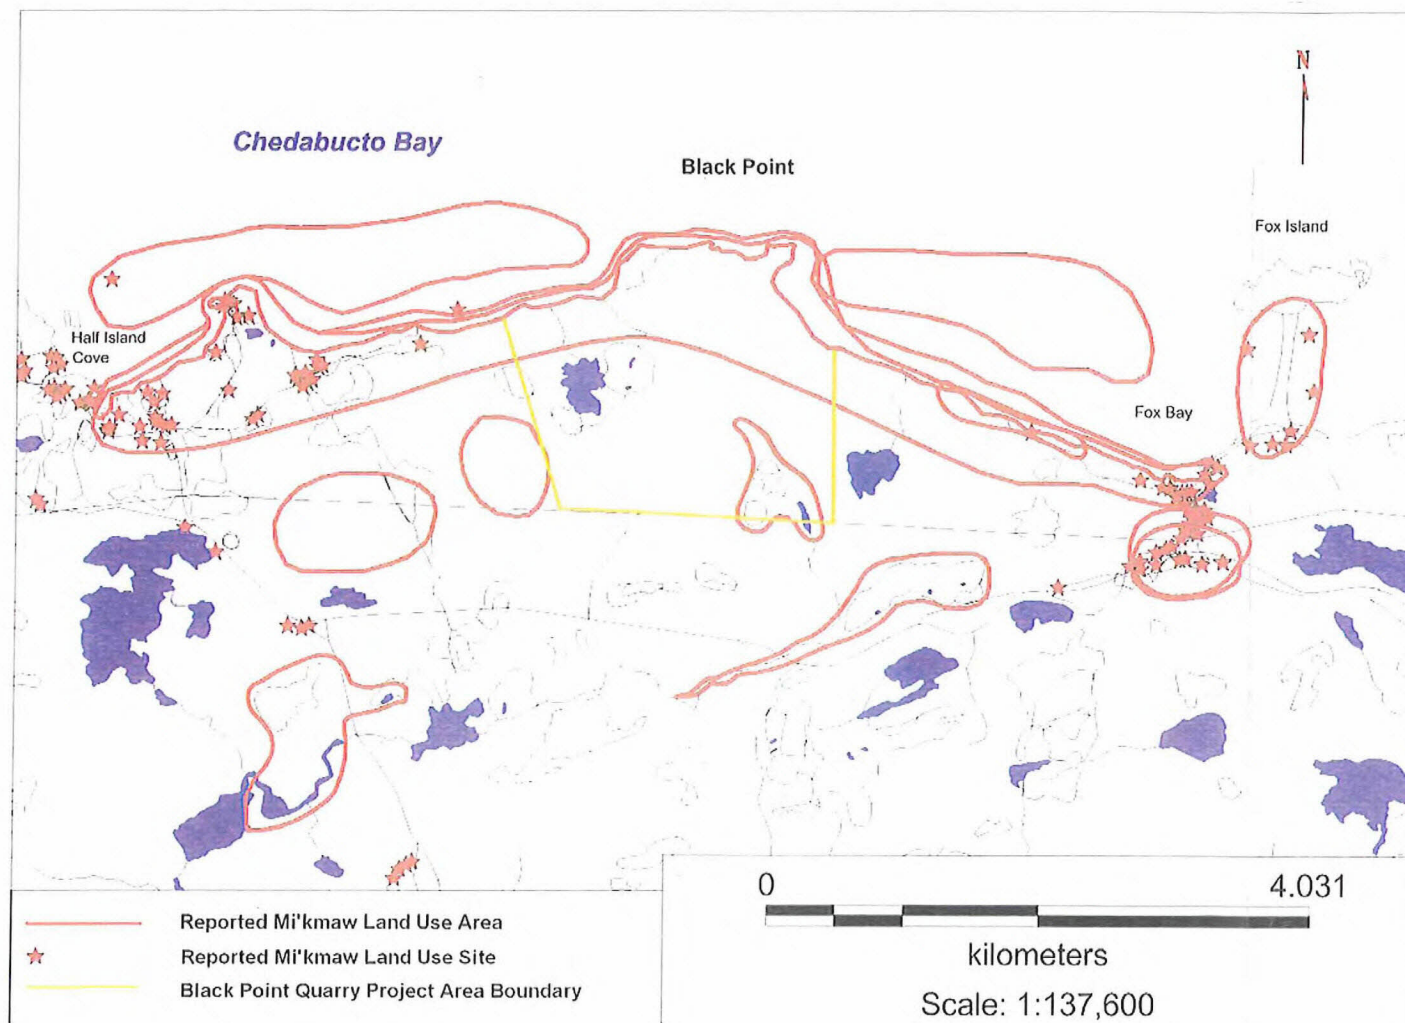

Conclusion

The historical review has found that Mi'kmaq have used sites surrounding the project area. Salmon River/Cooks Cove area was a long established Mi'kmaq community. The Canso Islands National Historic site of Canada recognized that Nicholas Denys first came to the Islands in the 1500's to fish and trade furs and that

"Archaeological evidence suggests that their Mi'kmaq trading partners had been coming to the islands for at least 1500 years before that".¹³⁸

Although no record was discovered, at this time, connecting the Mi'kmaq to the project area one can reasonably assume that it was highly probable due to the fact that the sites surrounding the project site were used by the Mi'kmaq.

Executive Summary

Davis MacIntyre & Associates Limited conducted an archaeological resource impact assessment of the proposed Black Point Quarry Project in Guysborough County. The assessment included consultation of historic maps, manuscripts, and previous archaeological assessments as well as the Maritime Archaeological Resource Inventory in order to determine the potential for archaeological resources in the study area. An archaeological reconnaissance of the proposed impact area was also conducted.

The assessment indicated that the presence of archaeological resources on the barrens was unlikely, but that the potential for such resources exists in the vicinity of a historic road and two bodies of water within the study area. As a result, it has been recommended that a detailed field reconnaissance be conducted prior to commencement of construction activities on the site.

1.0 INTRODUCTION

In July 2011, Davis MacIntyre & Associates Limited was contracted by AECOM on behalf of Erdene Resource Development Corp. to conduct an archaeological resource impact assessment of the proposed Black Point Quarry Project (aggregate quarry) in Guysboro County. The purpose of the assessment was to determine the potential for archaeological resources within the development zone and to provide recommendations for further mitigation if deemed necessary. This assessment included consultation of the Maritime Archaeological Resource Inventory in the Heritage Division of the Nova Scotia Museum as well as historic maps, manuscripts and published resources. A field reconnaissance of the impact area was also conducted in order to more thoroughly evaluate the archaeological potential of the area.

This assessment was conducted under Category C Heritage Research Permit A2011NS67 issued by the Nova Scotia Heritage Division. This report conforms to the standards required by the Heritage Division under the Special Places program.

2.0 STUDY AREA

Erdene Resource Development Corp. proposes to develop an aggregate quarry at Black Point on the Chedabucto Bay shore of Guysborough County. The project will be an open-pit quarry with associated facilities eventually covering approximately 79 hectares, and will include a wharf for loading product aboard bulk carriers for export to the eastern seaboard of the USA. An access road will also be required, to connect with the existing provincial road about 2.5 km distant. There are two possible sources of electric power for the project; it could be generated on-site with a diesel-powered generator, or it may be possible to tap into the closest transmission line, depending on the supply required. On-site equipment and facilities will include: a processing plant area, a ship loader system (conveyors), a marine terminal, and associated infrastructure.

The study area lies within the Canso Barrens natural theme region. In this unit, the upland surface is capped by granite knolls rising up to 200m above the sea along a straight northern coastline controlled by the Chedabucto Fault. The region extends northeast from New Harbour to the point of Cape Canso. Schists have formed from Meguma Group slates and greywacke. Approximately half of the unit's surface is

covered in thin deposits of granite, schist, and slate till, while the rest is exposed bedrock. Only a few drumlins have formed, comprised of red-brown till originating from Tor Bay and Canso Harbour. Coastal sediments are very limited.¹

Lakes and ponds in this region are found in a variety of sizes and are fed by streams and tributaries of a complex nature. Surface water is slightly acidic. The soil of the region is usually thin and often non-existent, exposing the undulating granite beneath. A form of imperfectly drained sandy loam known as Danesville gleyed podzol is common near the coast, and Gibraltar sandy loam is also present. Black Spruce is the most common tree type, and is found only in areas where the soil is thick enough to sustain larger vegetation, particularly in wetter areas. Balsam Fir is also common, while White Spruce, maple, and birch are also found. Low vegetation on the barrens includes Sheep Laurel, Huckleberry, Labrador Tea, Bracken Fern, alders, and stunted or scrubby Black Spruce. Rockweed and kelp thrive on the rocky shores.²

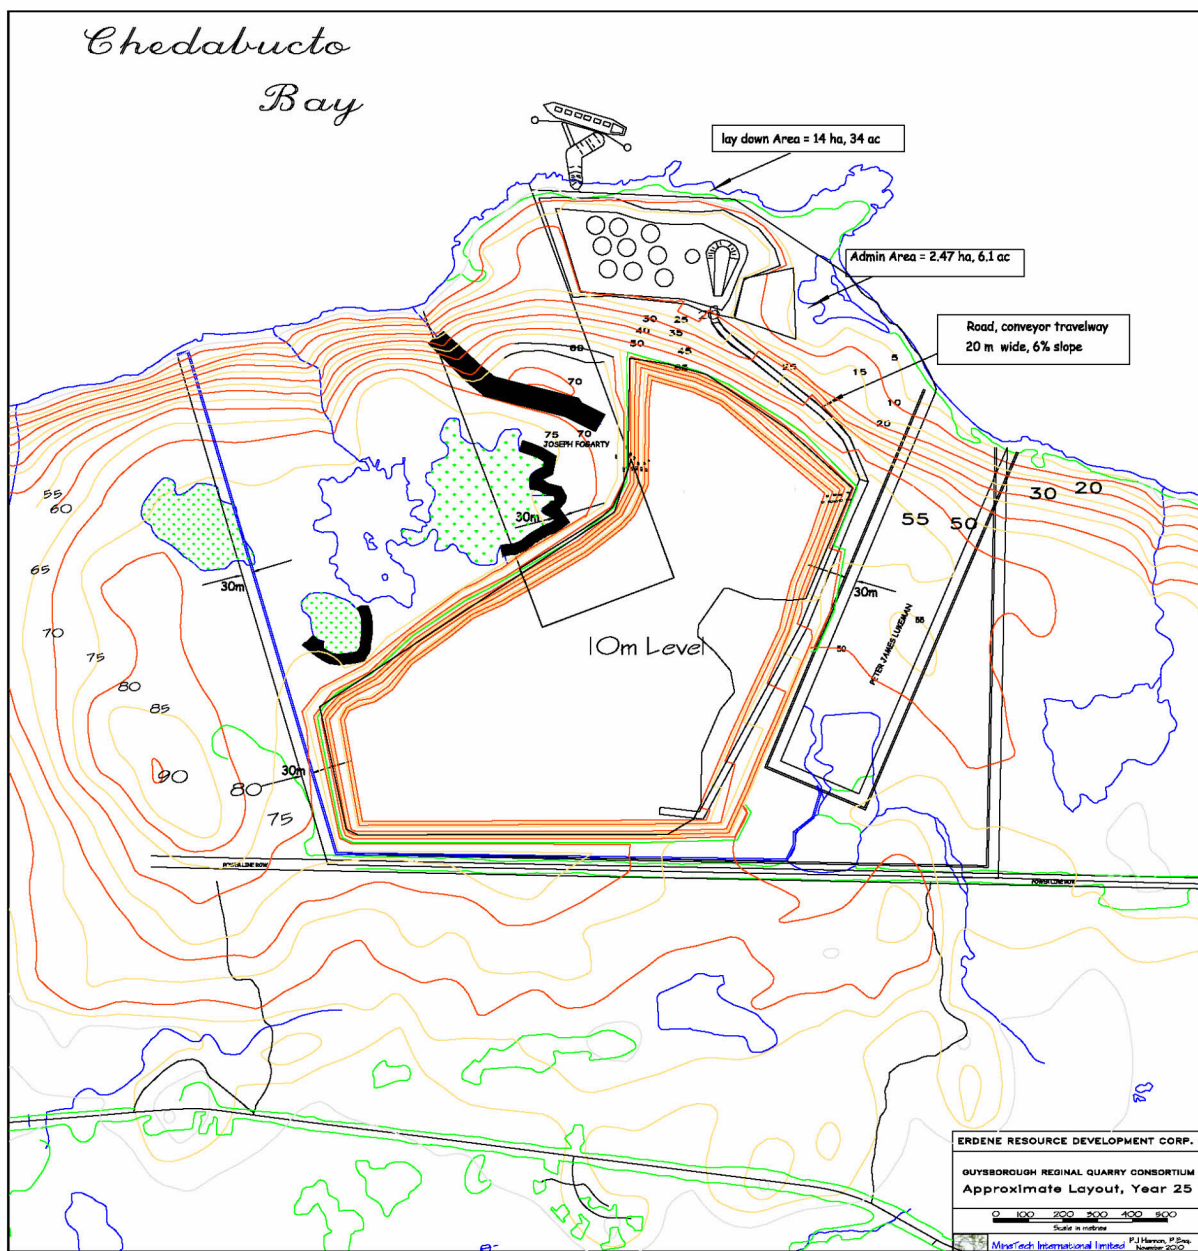

Although the provincial guide to natural theme regions states that “large areas of barren do not provide productive wildlife habitats,”³ the study area appears to support several established populations. During two days of field reconnaissance (see section 3.3 below), archaeologists observed frequent occurrences of animal tracks, including Black Bear, deer, raccoon, and coyote. Large quantities of coyote scat was also noted. A female partridge and her chicks were startled into open grass when the team passed nearby.

The natural theme region is documented to provide a breeding ground for various birds, including gulls, the Double-crested Cormorant, Great Blue Heron, Arctic Tern, Common Tern, and Common Eider.

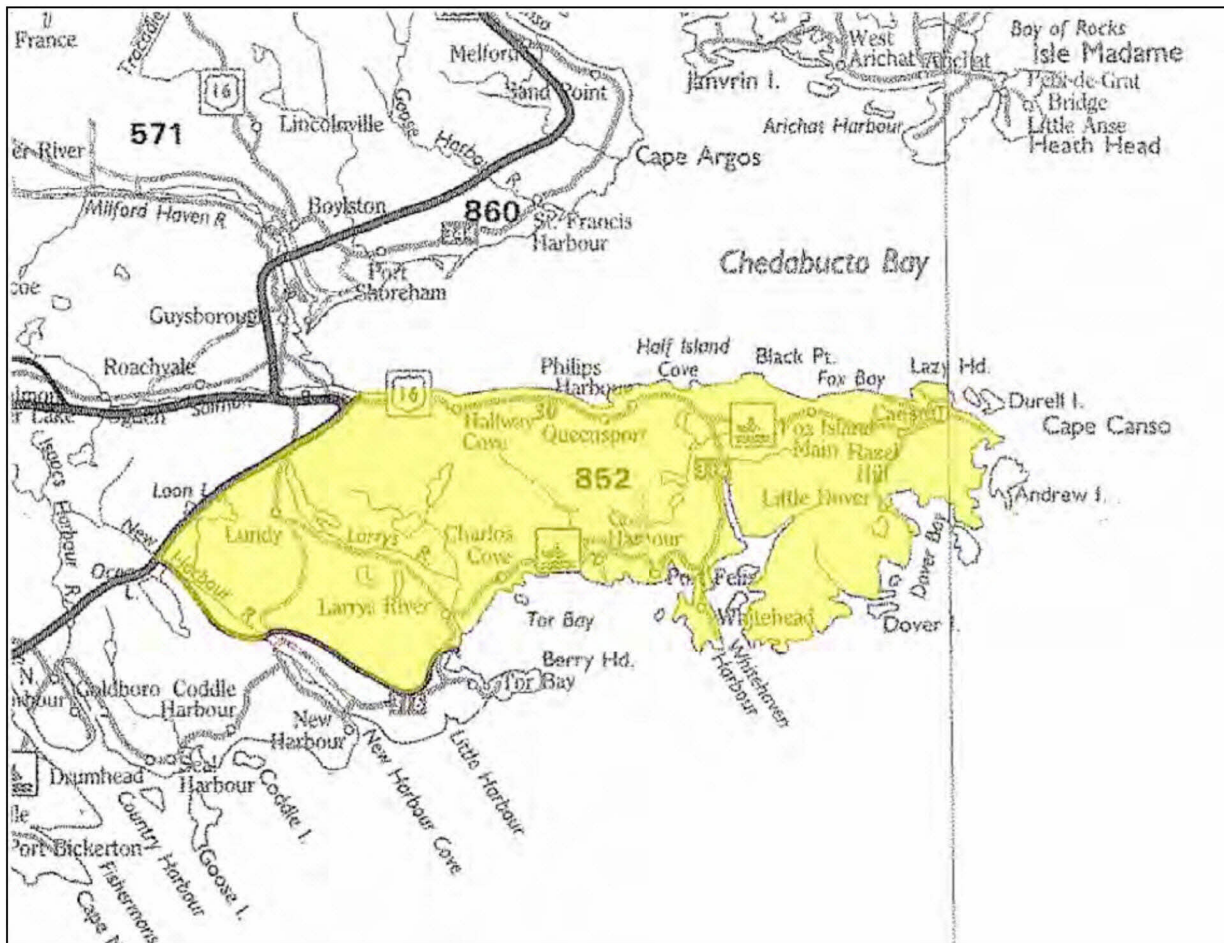

Figure 2.0-3: Natural Theme Regions of Nova Scotia, showing region 852 (highlighted) – Canso Barrens.

3.0 METHODOLOGY

A historic background study was conducted by Davis MacIntyre & Associates Limited in July 2011. Historical maps and manuscripts and published literature were consulted at Nova Scotia Archives and Records Management in Halifax. The Maritime Archaeological Resource Inventory, held at the Nova Scotia Museum's Heritage Division, was searched to understand prior archaeological research and known archaeological resources neighboring the study area. A preliminary archaeological reconnaissance of the impact area was also conducted.

3.1 Maritime Archaeological Resource Inventory

The Maritime Archaeological Resource Inventory, a Provincial database of known archaeological sites held at the Nova Scotia Heritage Division, was consulted in July 2011 to understand prior archaeological research and known archaeological resources neighboring the study area. Due to the sensitive nature of archaeological sites, exact locations have not been provided below.

The presence of stone “Indian relics” at the turn of the twentieth century was noted at two sites near Canso (George Island and Glasgow Head) by early historian and curator Harry Piers. A 1973 follow-up survey by Stephen Davis was unable to relocate either site, and so their exact locations remain unknown.

A copper pot burial site was encountered by locals at the mouth of the Salmon River near Guysborough. Copper pot or kettle burials are a particular type of First Nations burials that made use of the copper vessels acquired from early European traders.

Historic fortifications are known at Fort St. Louis in Chedabuctou (modern Guysborough). The remains are well-known through historic sources, and the recovery of an 18th or early 19th century bottle finish has helped to establish the occupation period of the site.

At Birchtown Lake, four sites including historic cellar depressions or house foundations have been reported, two of which contain more than one known depression. These features are all thought to be associated with the Black Loyalist community of Birchtown, inhabited in the mid to late 19th century. A cemetery associated with the community has also been reported.

The absence of recorded archaeological resources within or immediately adjacent the proposed development area is likely an indication that this area was not subjected to previous archaeological assessments.

3.2 Historical Background

3.2.1 The Precontact Period

The history of human occupation in Nova Scotia has been traced back approximately 11,000 years ago, to the Palaeo-Indian period or *Sa'qewe'k L'nu'k* (11,000 – 9,000 years BP). The only significant archaeological evidence of Palaeo-Indian settlement in the province exists at Debert/Belmont in Colchester County.

The *Saqiwe'k Lnu'k* period was followed by the *Mu Awsami Kejika'we'k L'nu'k* (Archaic period) (9,000 – 2,500 years BP), which included several traditions of subsistence strategy. The Maritime Archaic people exploited mainly marine resources while the Shield Archaic concentrated on interior resources such as caribou and salmon. The Laurentian Archaic is generally considered to be a more diverse hunting and gathering population.

The Archaic period was succeeded by the Woodland/Ceramic period or *Kejika'we'k L'nu'k* (2,500 – 500 years BP). Much of the Archaic way of subsistence remained although it was during this period that the first exploitation of marine molluscs is seen in the archaeological record. It was also during this time that ceramic technology was first introduced.

The Woodland period ended with the arrival of Europeans and the beginning of recorded history. The initial phase of contact between First Nations people and Europeans, known as the Protohistoric period, was met with various alliances particularly between the Mi'kmaq and French.

The Mi'kmaq inhabited the territory known as *Mi'kma'ki* or *Megumaage*, which included all of Nova Scotia including Cape Breton, Prince Edward Island, New Brunswick (north of the Saint John River), the Gaspé region of Quebec, part of Maine and southwestern Newfoundland (Figure 3.2-1).

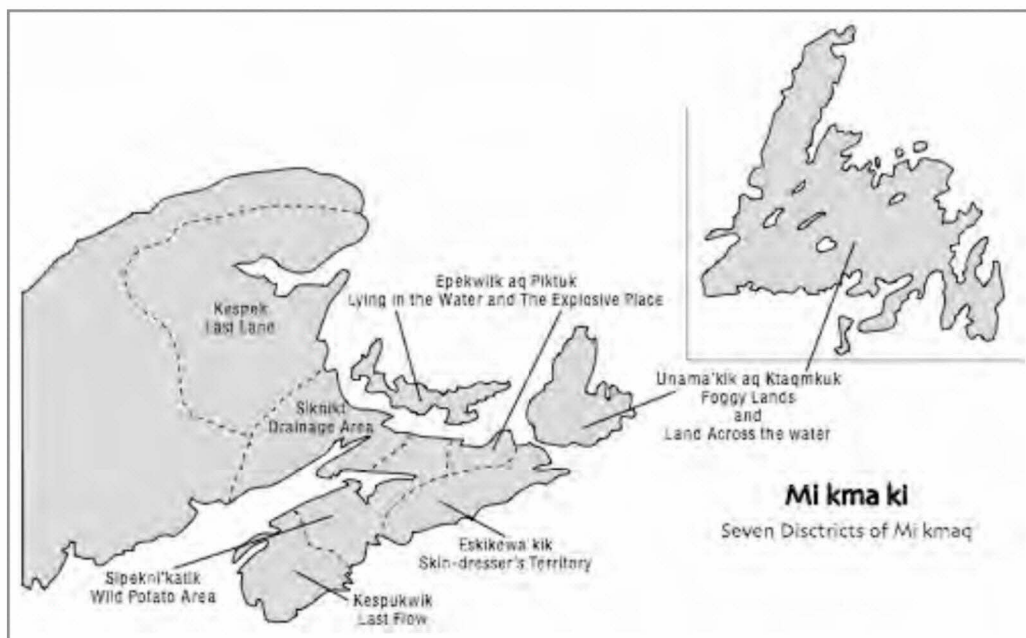

Figure 3.2-1: Map of the Mi'kmaq territories.⁴

A historical Mi'kmaq presence has been well documented in Guysborough County and specifically in the vicinity of Canso, less than 15 kilometres from the study area. In 1607 word reached Port Royal from Campseau (now Canso) that “the Dutch had insinuated themselves into the fur trade on the east shore, having been conducted by a treacherous Frenchman. The avarice of these people was so great, that they had opened the graves and taken the beaver skins in which it was customary for the Indians to wrap the dead. This conduct was so highly resented by the Indians of Canso that they killed the person who had shown the place where the dead were laid.”⁵

The place name “Canso” is believed to have originated from the Mi'kmaq term *Kamsok*, meaning “opposite lofty cliffs.”⁶ Chedabuctou Bay also derives from a Mi'kmaq name, historically also transcribed as *Sedabooktook*, and translated as “running far back.”⁷

⁷ Rand 1875:85.

3.2.2 European Settlement

It is thought that the French began fishing off the coast of Nova Scotia as early as 1504 and possibly earlier.⁸ Activity on land was coastal and seasonal, consisting of trade with the native Mi'kmaq and the use of beaches to dry fish for the long voyage back to France. The fishery continued to be profitable for centuries, supplying variously the French, English, and Basque seamen who sailed along these coasts. The plentiful stocks of fish in the area, particularly the cod, made it necessary for fishermen to establish *dégrats* or temporary processing stations on the shore.⁹

In 1518 Baron de Lery attempted to establish a colony in this new land. Finding himself unprepared for the extreme cold, however, he abandoned herds of cattle at nearby Canso as well as on Sable Island before returning to Europe with his fellow colonists. The cattle did not survive the winter, due either to the harsh conditions or to hunting by native bands.¹⁰

By the early seventeenth century the Jesuits had begun to establish themselves as missionaries in this area of the New World. In November 1629, a vessel wrecked somewhere in the vicinity of Canso leaving two Jesuit priests, Father Charles Lalemant and Father Alexandre de Vieuxpont, briefly stranded on an island. The victims of the wreck were buried, including Father Philibert Boyrot and his two nephews, presumably on the same island. Given the early date of this occurrence, it is difficult to precisely identify which island was host to the priests and the graves. It has been surmised that the island was Isle Madame, but nothing has yet been confirmed.¹¹

It has been suggested that a French settlement also existed at Philip's Harbour, west along the coast from Black Point. This suggestion originated from accounts that early British settlers to the area found the "ruins of several houses and stores" at this location.¹² Whether "the French" refers to early visitors or to a slightly later Acadian presence is unclear.

⁹ Dawson 1988:40.

¹⁰ Hart 1877:9.

¹¹ Johnston 1960:10-11, 14.

¹² Hart 1877:120.

Although the French had been controlling European settlement and trade in the seventeenth century, in 1713 the Treaty of Utrecht ceded *Acadie*, which included mainland Nova Scotia, to the English. Five years later, HMS *Squirrel* was sent to Canso to “dislodge” the French who were still successfully fishing in the area.¹³ The mid-eighteenth century saw a series of deportations of French settlers, including most notably the Acadians beginning in 1755. Canso’s French fishermen, however, continued to sail and fish in the vicinity of the Canso Islands, which they did not recognize as part of the mainland included in the 1713 Treaty.¹⁴ Disputes would continue throughout the eighteenth century.

Prior to 1721, a British Government regulation decreed that all tracts of forest land containing trees suitable for ship masts should be set aside as Crown Reserves.¹⁵ It is possible that this regulation was related to the surprising scarcity of land grants within the study area. Indeed, only two grants appear to have been made: the first to Michael Fogerty and the second to Peter James Lukeman (Figure 3.3-1).

Activity continued to increase along the Chedabucto Bay coast during the eighteenth century. By 1731, the fishery had grown so profitable that “there were more fish at Canso than there were vessels to carry to market.”¹⁶ In 1767, the population of Canso had grown to 519, of whom 197 were Acadian and 112 were Irish.¹⁷

Despite the strong Acadian population in the mid-eighteenth century, English dominance continued to assert itself as the years wore on. In 1815, Bishop Plessis noted “Manchester Bay borders the mainland of Nova Scotia, towards the north, and extends from the neighbouring Gut of Canso. The Indians and Acadians try to keep its former name – Chedabouctou Bay – but the English name prevails in spite of them.”¹⁸

Figure 3.3-1: The original land grants at Fogherty Head or Black Point.¹⁹

This coast of Chedabucto Bay may also have been the scene of an 1823 quadruple murder. On a calm April evening, four men were returning from Canso to Crow Harbour by boat. George Lamb, John McKenzie, Alexander Smith, and George Smith were never found, though oars from their boat with “ominous marks” were later recovered from the bay.²⁰

This was not the only violent incident along this shore. The Canso riots of 1835 are known to have spread to Fox Island, immediately west of the study area, though to what extent is not clear. Additionally, a 1908 account records the events at Fox Island around 1820:

During Father [James] Grant’s incumbency there arose great troubles and quarrels at Fox Island, then a very valuable fishing place on Guysborough Bay, near Canso. It appears the Island had been free to all, so that people

¹⁹ Department of Lands and Forests 1950.

²⁰ Hart 1877:120.

flocked from all parts for the fall mackerel, which was taken in great abundance. In those days there was no restraint on liquor, and where there was money there was liquor. Things got so bad that a squad of the army was sent for about two months to keep order. The Captain got tired of camp life, and said to his Colonel at Halifax, "There is a priest at Guysborough. If you can obtain his services, he will keep order better with his cane than we can with our guns." After that, Father Grant received £50 a year for keeping order. After some years the Harts secured the Island, and gave no place to fighting characters.²¹

In the 1880s and 1890s, at least sixteen families lived on Fox Island, having built their houses on the mainland side to shelter from the wind (Figure 3.3-2). A chapel was also located on Fox Island Main at Chapel Hill, possibly within the limits of the modern Seabreeze Campground and Cottages. During berry picking expeditions in the 1930s or 1940s, one local resident recalls observing the wooden foundations of the chapel. The resident's grandmother had informed him that a cemetery was associated with the chapel. It contained over 120 graves, marked only by wooden crosses or flat beach stones etched with names or dates. Two relatives of Martin Daley were buried here, after they drowned in a pond nearby. Native burials were also reportedly part of the cemetery.²²

Until 1857 the "Stagecoach Road" between Crow Harbour and Canso ran along the coast, passing closely to Fogherty Head and Black Point (Figure 3.3-3).²³ The rocky nature of this road meant that passage in the summer by buggy or wagon was nearly impossible. However, it appears that in the 1870s at least two houses were located in or near the eastern end of the study area. When the new road was built farther inland it encouraged settlement along level and fertile ground off the hard coastline.

²⁴ Library and Archives Canada 1894.

²⁵ Church 1876.

Oral history recounts that Black Point had a strong settlement in the late nineteenth century. The settlement included the Black Point School, and one oral report suggests that a Roman Catholic Church may have been located in the area.²⁶ Unfortunately, no other sources have directly confirmed the presence of this church. The only clue that may corroborate a church having stood in the vicinity is a vital statistics record showing that Murdock McNeil and Bridget Eaton were married on July 2nd, 1891 at Black Point, Guysborough County under a Roman Catholic licence.²⁷

Local residents also report that Martin Daley (likely the “M. Daley” shown on Figure 3.3-3) and his son Vincent were the last residents of Black Point. In his later years, Martin lived at nearby Fox Island or Fox Island Main during the week, working as a fisherman. On weekends, he would return to Black Point to live with his son. The two were both farmers and fishermen, a type of dual employment that was not uncommon on the coast of Nova Scotia during the nineteenth and early twentieth century. Sometime after the 1930s, the Daley house was demolished, as presumably was the associated barn. Both were located in a meadow with a brook running down its centre, where one local resident reported pasturing his family horse in the summers.²⁸

Sometime after all of the residents of Black Point had moved to Fox Island Main or further afield, John Rhynold and his son reportedly flew a flag on Black Point in memorial to John’s mother, who was born at Black Point.²⁹ Additionally, a descendent of the Lukeman family kept a cabin on his family property at Fogherty Head, and used to visit the site each year.³⁰

3.3 Field Reconnaissance

A partial field reconnaissance of the study area was conducted by Stephen Davis and Laura de Boer on July 12th and 13th, 2011. The goal of the reconnaissance was to establish the layout and conditions of the study area in order to determine whether or not a complete walkover survey would be necessary.

On July 12th, the team accessed the study area via a narrow logging road leading north from Highway 16. This road terminated at a transmission line corridor, which when followed east lead to the southwestern corner of the study area. The southern border of the proposed impact area was found to consist of a moderate south-facing slope, formed of shallow granite bedrock with thin soil. Scrubby brush and sparse black spruce predominate, and as mentioned above evidence for a variety of wildlife was noted, including bear, coyote, partridge, and deer. A crown land marker was observed at the northern termination of the project right-of-way (Plate 1).

When archaeologists reached the marker delineating the western-most corner of the Department of Natural Resources land, they followed a rough trail leading north and created by geotechnical testing equipment. The trail led upwards into a mostly treeless area of granite barrens (Plate 2). The “FOX” geodetic marker was observed on the barrens (Plate 3), though no other evidence of cultural activity was visible outside of the equipment track.

Farther north, the barrens began to slope downwards towards the ocean. When the team reached the southwestern corner of the Fogarty property, inclement weather prompted the decision to continue the survey the following day.

On July 13th, archaeologists returned to the southwestern corner of the Fogarty property using the same access route. The rough equipment trail was found to continue along the southern and then the northeastern edge of the property, and so the team continued to utilize this trail as the path of least resistance through the scrubby vegetation and low, wet areas of the barrens. It was hoped that the old road to Canso would be encountered by following this path, but unfortunately the equipment trail appeared to have gradually been lost before it transected the roadbed. Several hundred metres west of the point marked “5001” on Figure 2.0-1, it was determined that enough data on the barrens

portion of the study area had been gathered, and the team exited the site via the logging road in the southwest.

4.0 RESULTS AND DISCUSSION

The high and inhospitable nature of the barrens suggests that little cultural activity, whether Precontact or historic, would have occurred in the central portion of the study area. However, the presence of the old road to Canso suggests that any historic settlement would have closely bordered this thoroughfare, which according to local oral reports is still visible.³¹ In addition, predictive modeling suggests that any First Nations activity would have been in proximity to the sparse fresh water resources in the area, including the outlet of Fogherty Lake and the Barachois that appears to have formed on the northeast coast of the study area, immediately south of Black Point. Both of these areas are predicted to be better accessed by water at this point, given the steep slope rising above the shore. It is likely that the historic road is better accessed from above, and will need to be walked in its entirety, if possible, to determine if any archaeological resources can be found on either side of it.

5.0 CONCLUSIONS AND RECOMMENDATIONS

It is recommended that the historic coastal road to Canso be walked to examine either side for archaeological resources. In addition, survey of the two areas of elevated potential for First Nations activity, being the outlet of Fogherty Lake and the Barachois southeast of Black Point, be examined. This portion of the property may be most conveniently accessed by boat rather than on foot. It is unlikely that archaeological resources exist on the granite barrens that make up much of the central study area, and as such, no further mitigation for that area is recommended at this time.

Plate 29: The open meadow on the historic Fogarty side of the property, looking south.	63
Plate 30: The first of two stone pads located in the meadow, looking west.	63
Plate 31: Looking west down the meadow towards the two stone features (blue).	64
Plate 32: A cast iron stove fragment and a historic brick fragment on the first of the two stone features.	64
Plate 33: Courtney Glen stands inside the heavily overgrown stone cellar, looking east.	65
Plate 34: The stone outline of a probable outbuilding, looking west.	65
Plate 35: An earthen depression in the side of a slope suggests another outbuilding, looking northeast.	66
Plate 36: Fragments of a cast iron stove near the Fogarty foundation, looking west.	66
Plate 37: The smooth topography of this headland suggests it may have been an appropriate location for family burials; digging graves would have been easier than the rocky land all around, while the scenic look off towards Half Island Cove is the type of view that is found at many historic cemeteries.	67

EXECUTIVE SUMMARY

In October 2014, Davis MacIntyre & Associates Limited was contracted by SLR Consulting to conduct an archaeological resource impact assessment of the proposed site of the Black Point Quarry at Fogherty Head, near Canso in Guysborough County. The purpose of the assessment was to determine the potential for archaeological resources within the development zone and to provide any recommendations for further mitigation, if deemed necessary, and to fulfill the recommendations made in 2011. The assessment consisted of a reconnaissance of the study area and additional documentary research, following a background study and preliminary reconnaissance of the granite barren portion of the study area in 2011 under HRP#A2011NS67.

The reconnaissance has resulted in six probable historic house foundations and five probable outbuilding foundations identified on the lowland of the study area, below the level of the granite barrens. Of these six houses, three are believed to be related to the extended Lukeman family, one to the Fogarty family, and two more to the Daly family. Maritime Archaeological Resource Inventory (MARI) forms for all six have been completed for submission to CCH and the Nova Scotia Museum.

Potential construction impacts arise from removal of large quantities of fill and native soil, potentially unearthing, damaging, or destroying archaeological resources. Of the six identified historic homesteads, two are expected to be impacted by the development. The potential for First Nations archaeological resources has been determined to be low, though contingency measures will be in place to deal with the unlikely discovery of such resources. DM&A has completed an Archaeological and Heritage Resources Management Plan for the proponent, included here as Appendix C.

It is recommended that the three foundations at the east end of the property (the two on the former Lukeman property, and the third just beyond the western boundary on the former Crown parcel referred to as Black Point 1), as well as the foundation and four outbuildings on the former Fogarty property, be avoided by construction activities. It is recommended that these features be well flagged by an archaeologist and a 100 meter buffer be established around the features to ensure that their locations and boundaries are well-known and they are not disturbed during construction. It is also understood and recommended that the headland on the northwest end of the former Fogarty property that may be the location of reported historic burials will be avoided by construction. It is recommended that this area also be flagged and that the buffer zones for these resources be surveyed for future reference. It is recommended that the flagging be removed after construction so as to avoid drawing unwanted attention to these features in order to avoid looting or damage to the sites.

Mitigation of Black Point Homestead 2 and Black Point Homestead 3, which cannot be easily avoided by the development, is recommended prior to commencement of the quarry infrastructure construction. The testing phase should therefore consist of a

formal testing regiment on both of the two sites to be impacted. Prior to excavation, the sites should be cleared of brush, branches, moss and other vegetation, etc. by the archaeological team to allow for detailed surface documentation. Two intersecting lines of formal 0.50 m by 0.50 m excavation units at 1 meter intervals are recommended through the center of both foundations. This is intended to establish a sense of the buildings' interior and exterior remains (both structural and artifactual), layout, stratigraphy and site formation, as well as site integrity. Formal testing is also recommended for the associated outbuilding in order to determine function and site layout. This program of testing will aid in establishing an assessment of site significance which will, in turn, allow the archaeologists to determine the best course for further mitigation, if necessary. At this time it is anticipated that some additional excavation following testing may be necessary at Black Point 3, which is unique in layout at Fogherty Head.

In the event that any archaeological material is encountered during ground disturbance activities and an archaeologist is not already present on the site, all activity should cease and the Coordinator of Special Places, Sean Weseloh-McKeane (902-424-6475) should be contacted immediately to determine a suitable method of mitigation.

1.0 INTRODUCTION

In October 2014, Davis MacIntyre & Associates Limited was contracted by SLR Consulting to conduct an archaeological resource impact assessment of the proposed site of the Black Point Quarry at Fogherty Head, near Canso in Guysborough County. The purpose of the assessment was to determine the potential for archaeological resources within the development zone and to provide any recommendations for further mitigation, if deemed necessary, and to fulfill the recommendations made in 2011. The assessment consisted of a reconnaissance of the study area and additional documentary research, following a background study and preliminary reconnaissance of the granite barren portion of the study area in 2011 under HRP#A2011NS67.

This assessment was completed under Category C Heritage Research Permit A2014NS099 issued by the Nova Scotia Culture and Heritage Development Division. This report conforms to the standards required by the Department of Communities, Culture and Heritage as specified under the guidelines of the Special Places Protection Act (*R.S., c. 438, s. 1.*).

2.0 STUDY AREA

Vulcan Materials Inc. and Morien Resources propose to develop an aggregate quarry at Black Point on the Chedabucto Bay shore of Guysborough County, between Half Island Cove and Fox Island Main near Canso (Figures 2.0-1 and 2.0-2). The project will be an open-pit quarry with associated facilities eventually covering 238 hectares of the 354 hectare property, and will include a wharf for loading product aboard bulk carriers for export to the eastern seaboard of the United States. An access road will also be required, to connect with the existing provincial road about 2.5 km distant. There are two possible sources of electric power for the project; it could be generated on-site with a diesel-powered generator, or it may be possible to tap into the closest transmission line, depending on the supply required. On-site equipment and facilities will include: a processing plant area, a ship loader system (conveyors), a marine terminal, and associated infrastructure.

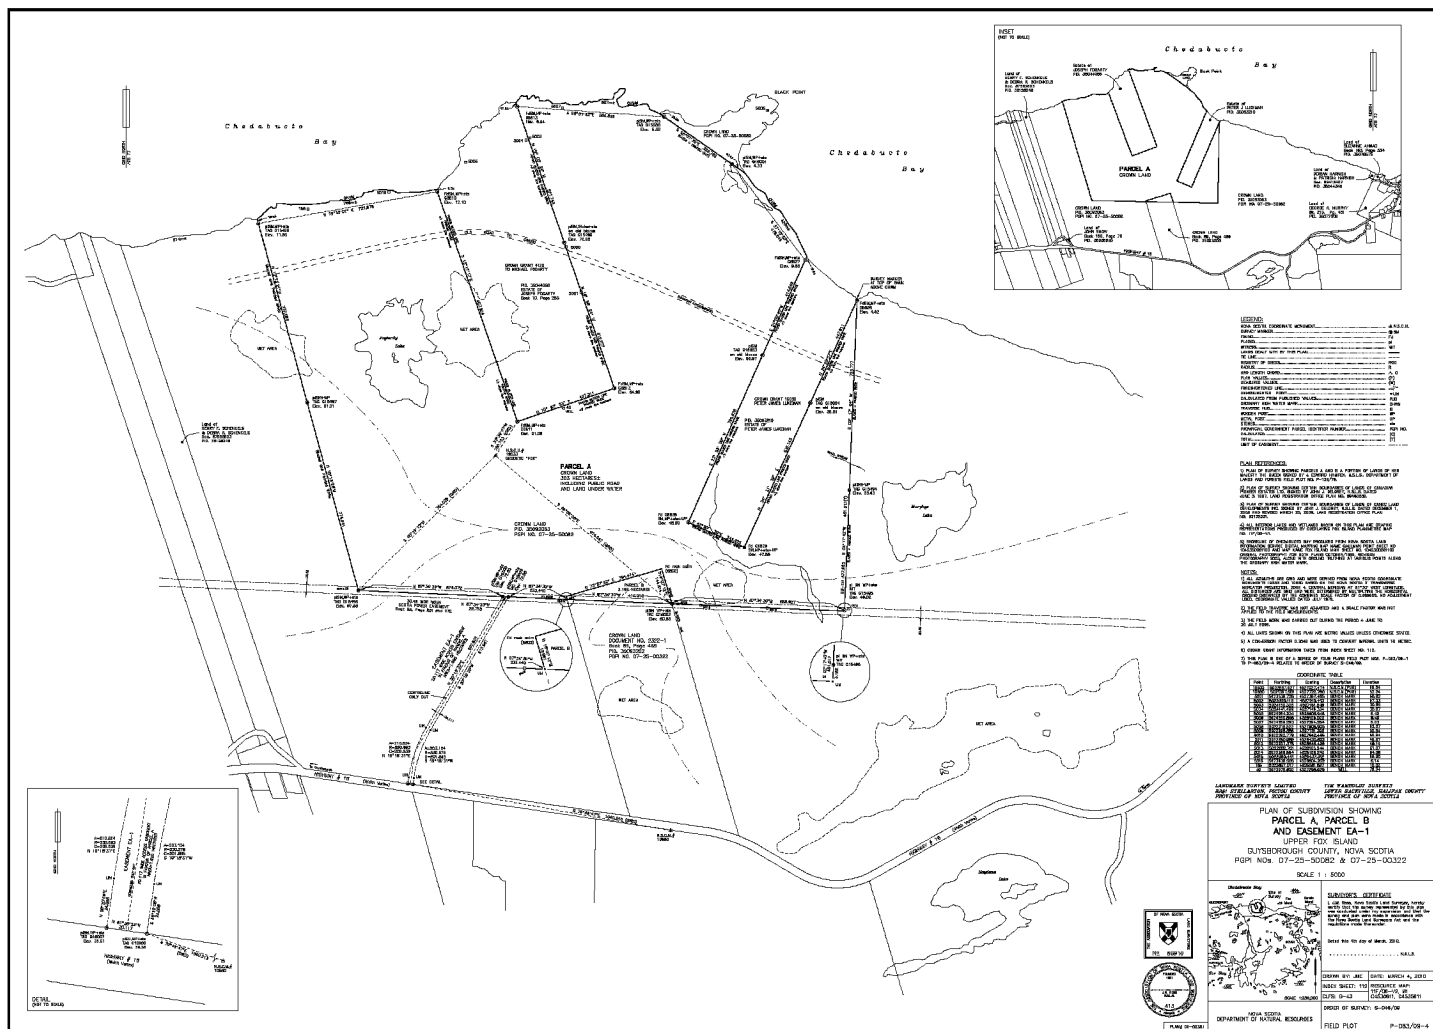

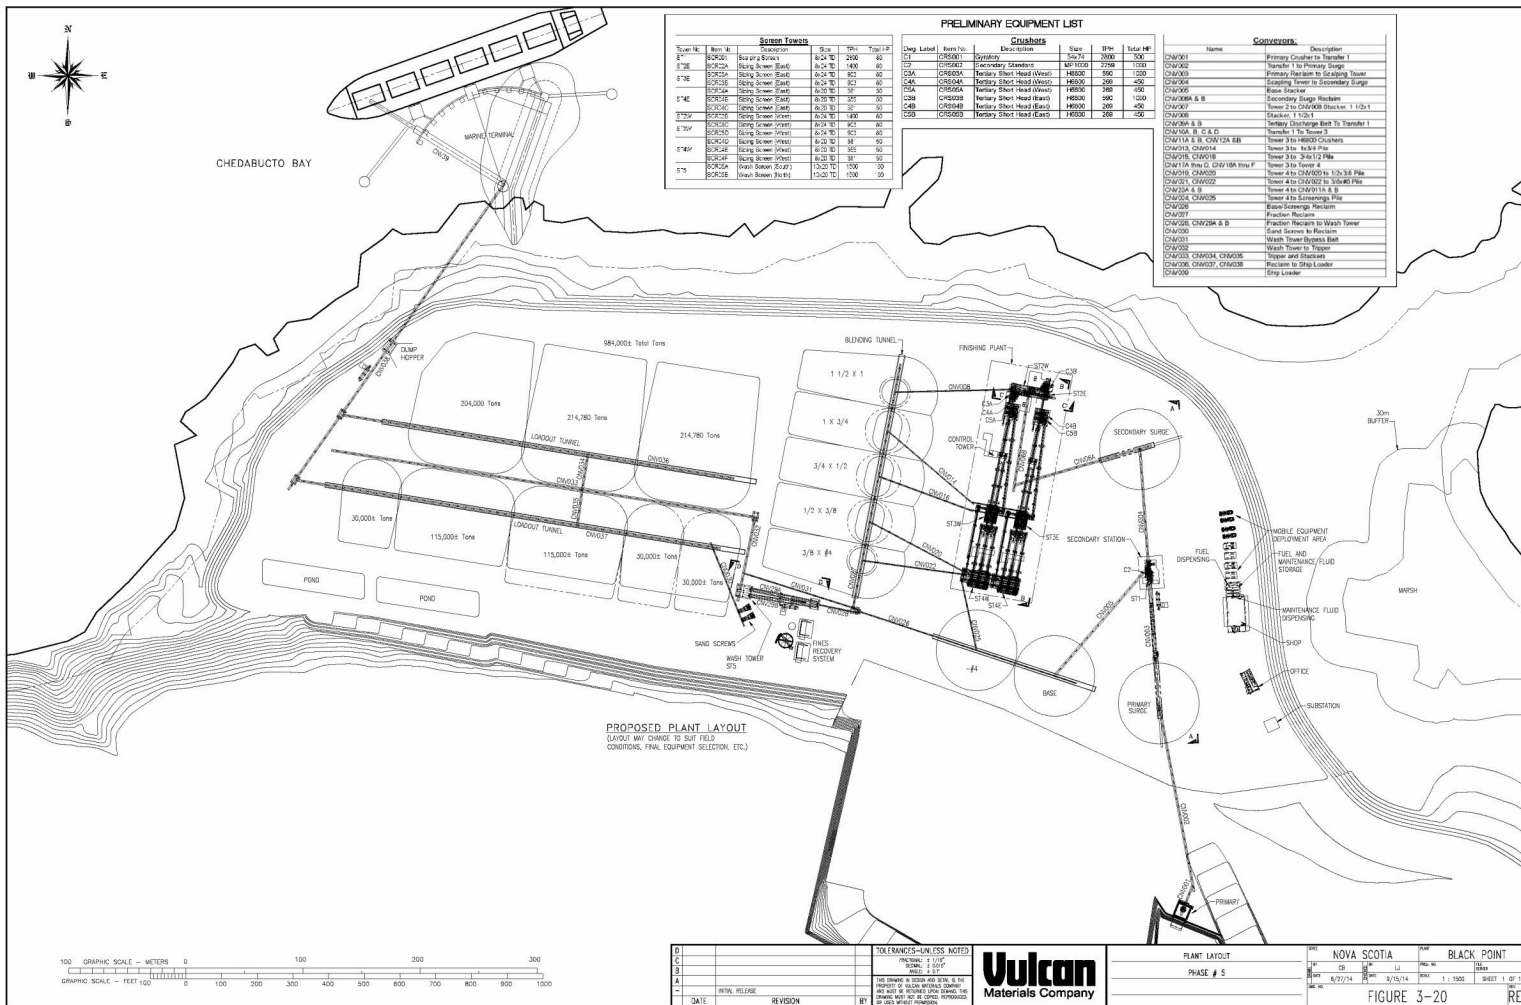

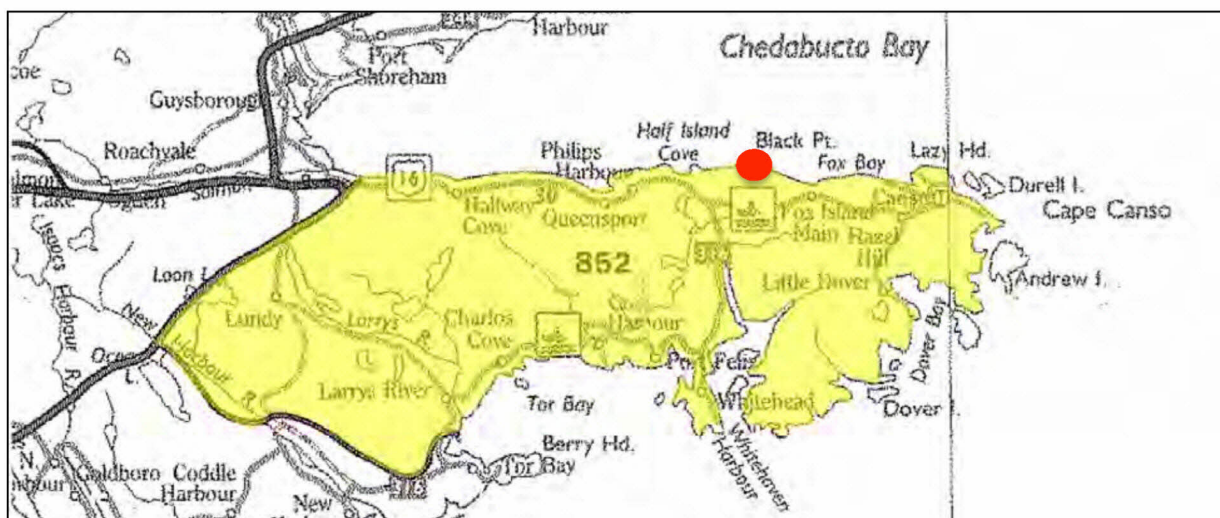

Figure 2.0-1: A survey plan showing the study area, which encompasses former Crown land as well as two historic grants. Courtesy AECOM (2011).

The study area lies within the Canso Barrens natural theme region (Figure 2.0-3). In this unit, the upland surface is capped by granite knolls rising up to 200m above the sea along a straight northern coastline controlled by the Chedabucto Fault. The region extends northeast from New Harbour to the point of Cape Canso. Schists have formed from Meguma Group slates and greywacke. Approximately half of the unit's surface is covered in thin deposits of granite, schist, and slate till, while the rest is exposed bedrock. Only a few drumlins have formed, comprised of red-brown till originating from Tor Bay and Canso Harbour. Coastal sediments are very limited.¹

Lakes and ponds in this region are found in a variety of sizes and are fed by streams and tributaries of a complex nature. Surface water is slightly acidic. The soil of the region is usually thin and often non-existent, exposing the undulating granite beneath. A form of imperfectly drained sandy loam known as Danesville gleyed podzol is common near the coast, and Gibraltar sandy loam is also present. Black Spruce is the most common tree type, and is found only in areas where the soil is thick enough to sustain larger vegetation, particularly in wetter areas. Balsam Fir is also common, while White Spruce, maple, and birch are also found. Low vegetation on the barrens includes Sheep Laurel, Huckleberry, Labrador Tea, Bracken Fern, alders, and stunted or scrubby Black Spruce. Rockweed and kelp thrive on the rocky shores.²

The natural theme region is documented to provide a breeding ground for various birds, including gulls, the Double-crested Cormorant, Great Blue Heron, Arctic Tern, Common Tern, and Common Eider.

3.0 METHODOLOGY

A reconnaissance was conducted of key areas of the study area identified in 2011 as meriting a more detailed walkover survey. This included the outflow from Fogarty Lake and the barachois on the lowland of Fogherty Head, along with the coastline of Fogherty Head and several areas of historic occupation identified through oral history and historic mapping.

When a descendant of the Fogarty family, who had previously held a grant of land at Fogherty Head, expressed concerns regarding homesteads and family burials on the property, additional archival research was also conducted in order to determine whether any burials may have occurred on the land and whether a Catholic church ever existed within the study area. Research was also conducted on the Daly and Lukeman families, in order to help identify the original inhabitants of any identified homesteads, and to investigate the possibility of other family burials at Fogherty Head.

3.1 Maritime Archaeological Resource Inventory

The Maritime Archaeological Resource Inventory, a Provincial database of known archaeological sites held at the Nova Scotia Heritage Division, was consulted in July 2011 to understand prior archaeological research and known archaeological resources neighbouring the study area. A review of the database was conducted again in October 2014.

The presence of stone “Indian relics” at the turn of the twentieth century was noted at two sites near Canso (George Island and Glasgow Head) by early historian and curator Harry Piers. A 1973 follow-up survey by Stephen Davis was unable to relocate either site, and so their exact locations remain unknown.

A copper pot burial site was encountered by locals at the mouth of the Salmon River near Guysborough. Copper pot or kettle burials are a particular type of First Nations burials that made use of the copper vessels acquired from early European traders.

Historic fortifications are known at Fort St. Louis in Chedabuctou (modern Guysborough). The remains are well-known through historic sources, and the recovery of an 18th or early 19th century bottle finish has helped to establish the occupation period of the site.

An eighteenth to nineteenth century fishing room on Clarke Island off Canso was identified and tested in June of 2014. The room, or fish drying and processing complex, belonged to Andrew Robinson.

The absence of recorded archaeological resources within or immediately adjacent the proposed development area is likely an indication that this area was not subjected to previous archaeological assessments.

3.2 Historical Background

3.2.1 The Precontact Period

The history of human occupation in Nova Scotia has been traced back approximately 11,000 years ago, to the Palaeo-Indian period or *Sa'qewe'k L'nu'k* (11,000 – 9,000 years BP). The only significant archaeological evidence of Palaeo-Indian settlement in the province exists at Debert/Belmont in Colchester County.

The *Saqiwe'k Lnu'k* period was followed by the *Mu Awsami Kejikawe'k L'nu'k* (Archaic period) (9,000 – 2,500 years BP), which included several traditions of subsistence strategy. The Maritime Archaic people exploited mainly marine resources while the Shield Archaic concentrated on interior resources such as caribou and salmon. The Laurentian Archaic is generally considered to be a more diverse hunting and gathering population.

The Archaic period was succeeded by the Woodland/Ceramic period or *Kejikawek L'nu'k* (2,500 – 500 years BP). Much of the Archaic way of subsistence remained although it was during this period that the first exploitation of marine molluscs is seen in the archaeological record. It was also during this time that ceramic technology was first introduced.

The Woodland period ended with the arrival of Europeans and the beginning of recorded history. The initial phase of contact between First Nations people and Europeans, known as the Protohistoric period, was met with various alliances particularly between the Mi'kmaq and French.

The Mi'kmaq inhabited the territory known as *Mi'kma'ki* or *Megumaage*, which included all of Nova Scotia including Cape Breton, Prince Edward Island, New Brunswick (north of the Saint John River), the Gaspé region of Quebec, part of Maine and southwestern Newfoundland (Figure 3.2-1).

A historical Mi'kmaq presence has been well documented in Guysborough County and specifically in the vicinity of Canso, less than 15 kilometres from the study area. In 1607

word reached Port Royal from Campseau (now Canso) that “the Dutch had insinuated themselves into the fur trade on the east shore, having been conducted by a treacherous Frenchman. The avarice of these people was so great, that they had opened the graves and taken the beaver skins in which it was customary for the Indians to wrap the dead. This conduct was so highly resented by the Indians of Canso that they killed the person who had shown the place where the dead were laid.”³

The place name “Canso” is believed to have originated from the Mi’kmaq term *Kamsok*, meaning “opposite lofty cliffs.”⁴ Chedabuctou Bay also derives from a Mi’kmaq name, historically also transcribed as *Sedabooktook*, and translated as “running far back.”⁵

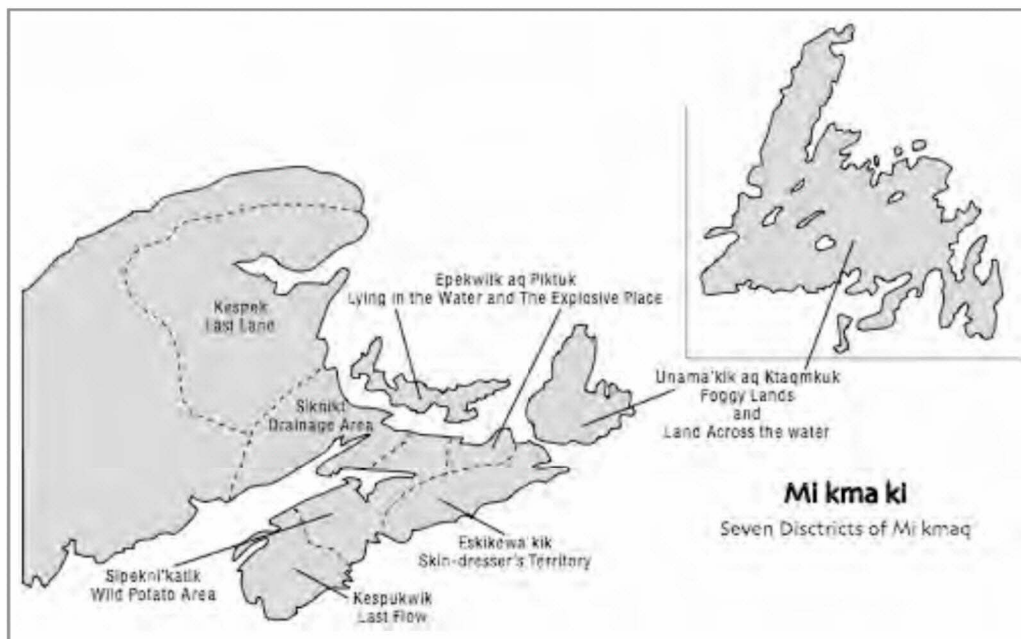

Figure 3.2-1: Map of the Mi’kmaq territories.⁶

3.2.2 European Settlement

It is thought that the French began fishing off the coast of Nova Scotia as early as 1504 or possibly earlier.⁷ Activity on land was coastal and seasonal, consisting of trade with the native Mi’kmaq and the use of beaches to dry fish for the long voyage back to

⁷ Hart 1877:9.

France. The fishery continued to be profitable for centuries, supplying variously the French, English, and Basque seamen who sailed along these coasts. The plentiful stocks of fish in the area, particularly the cod, made it necessary for fishermen to establish *dégrats* or temporary processing stations or “rooms” on the shore.⁸

Although the French had been controlling European settlement and trade in the seventeenth century, in 1713 the Treaty of Utrecht ceded *Acadie*, which included mainland Nova Scotia, to the English. Five years later, HMS *Squirrel* was sent to Canso to “dislodge” the French who were still successfully fishing in the area.⁹ The mid-eighteenth century saw a series of deportations of French settlers, including most notably the Acadians beginning in 1755. Canso’s French fishermen, however, continued to sail and fish in the vicinity of the Canso Islands, which they did not recognize as part of the mainland included in the 1713 Treaty.¹⁰ Disputes would continue throughout the eighteenth century.

Activity continued to increase along the Chedabucto Bay coast during the eighteenth century. By 1731, the fishery had grown so profitable that “there were more fish at Canso than there were vessels to carry to market.”¹¹ In 1767, the population of Canso had grown to 519, of whom 197 were Acadian and 112 were Irish.¹²

The fishery was not a quiet industry. The Canso riots of 1835 are known to have spread to Fox Island, immediately west of the study area, though to what extent is not clear. Additionally, a 1908 account records the events at Fox Island around 1820:

During Father [James] Grant’s incumbency there arose great troubles and quarrels at Fox Island, then a very valuable fishing place on Guysborough Bay, near Canso. It appears the Island had been free to all, so that people flocked from all parts for the fall mackerel, which was taken in great abundance. In those days there was no restraint on liquor, and where there was money there was liquor. Things got so bad that a squad of the army was sent for about two months to keep order. The Captain got tired of camp life, and said to his Colonel at Halifax, “There is a priest at Guysborough. If you can obtain his services, he will keep order better with his cane than we can with our guns.” After that, Father Grant received £50 a year for keeping order. After some years the Harts secured the Island, and gave no place to fighting characters.¹³

¹² Johnston 1960:85.

¹³ Father Michael Tompkins, 1908, quoted in Johnston 1960:468-9.

At Fogherty Head itself, only two formal grants of land appear to have been made: the first to Michael Fogerty and the second to Peter James Lukeman (Figure 3.3-1). Both of these grants existed in their original size and shape, with no subdivisions or additional grants, until the land was acquired or expropriated for development as the Black Point Quarry.

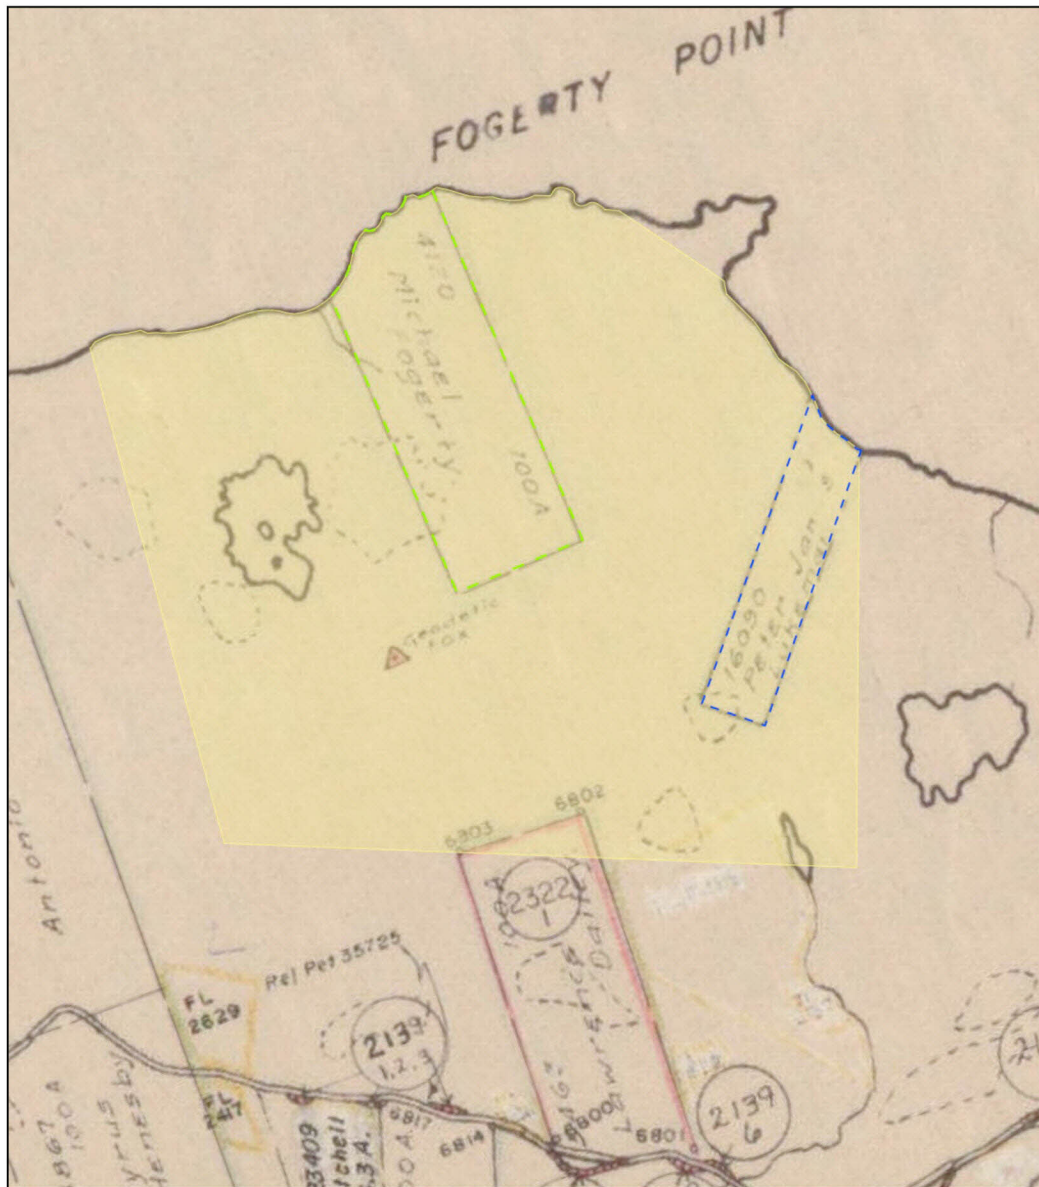

Figure 3.2-2: A plan showing the original land grants at Fogherty Head or Black Point: Michael Fogarty (Green) and Peter James Lukeman (Blue) with the approximate study area (Yellow).¹⁴

¹⁴ Department of Lands and Forests 1950.

In most instances elsewhere in the province, the Geological Survey of Canada maps completed by Hugh Fletcher and Eugene R. Faribault are considered superior in detail and accuracy to the Ambrose Church map series. However, in this case Faribault appears to have made more errors than usual: his 1893 map completely omits the nearby Murphy's Lake to the southeast of the study area, while showing the Old Canso Road as remaining atop the granite barrens across Fogherty Head (Figure 3.2-4). Based upon field findings and on the relation of the Lukeman and Daly homes to the road shown on the Church map, the Old Canso Road or at least a branch of road running from Fox Island Main may have traversed the lowlands on the eastern side of Fogherty Head. No houses are shown on this map, although all other sources point to at least some occupation at this time.

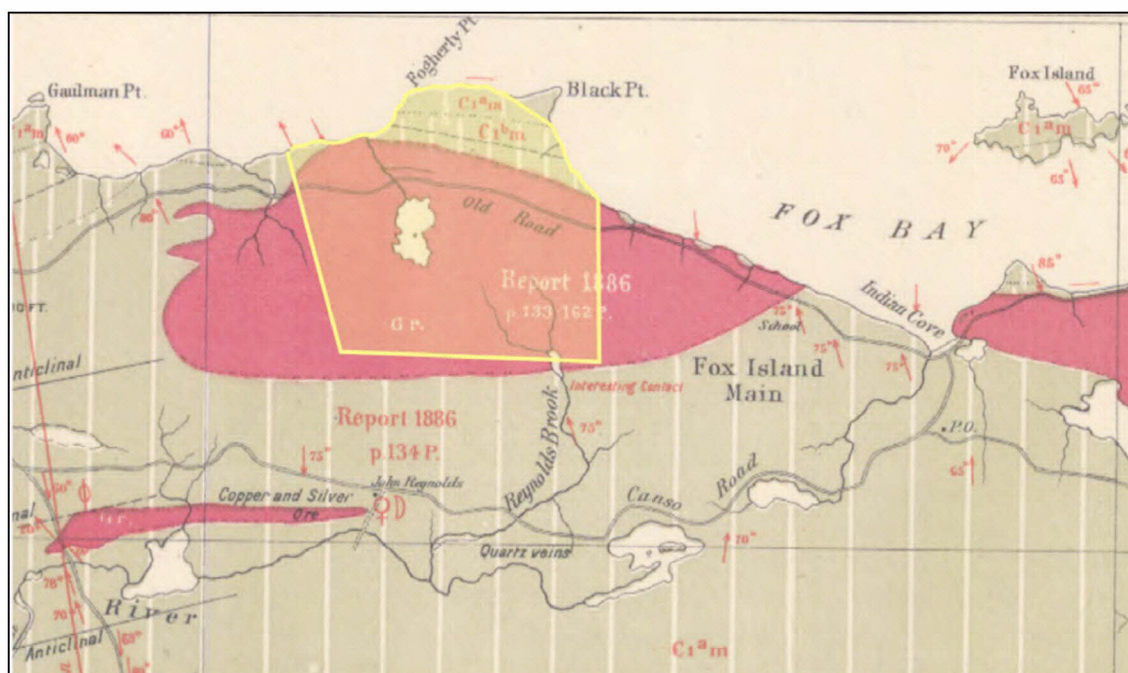

Figure 3.2-4: An 1893 map appears to lack the usual accuracy of the Geological Survey of Canada maps from this period: Murphy's Lake is omitted along with Fogarty Lake being placed eastward of its true location, while the map as a whole was not accurately proportioned enough for modern georeferencing.¹⁸ The approximate study area is shown in yellow.

An 1883 map from the Crown Lands office shows the homes of Edward Daly and Mrs. Lukeman within the study area (Figure 3.2-5), while John Fogarty is shown, surprisingly, immediately east of the Lukeman grant and just outside the study area. Three "fishing huts" are also shown on Black Point itself, outside of the study area.

¹⁸ Faribault 1893.

Figure 3.2-5: Detail of an 1883 map from the Crown Lands office shows the homes of Mrs. Lukeman and Ed. Daily (Edward Daly) within the study area, and John Fogarty just outside the study area to the east. Note the dotted line most likely indicating an agricultural area around the three houses. Three “fishing huts” are also shown on Black Point outside the study area, while the granite barrens to the south are marked as “High barren land here.”¹⁹

Oral history recounts that Black Point had a strong settlement in the late nineteenth century. The settlement included the Black Point School located east of the study area near Fox Island main (refer back to Figure 3.2-3), and one oral report suggests that a Roman Catholic Church may have been located in the area.²⁰ No other sources have

¹⁹ Hartshorne 1883.

²⁰ MacDuff, Everett, personal communication 20 July 2011, and Grant, James, personal communication 12 July 2011.

confirmed the presence of this church. This includes contact with the Catholic Diocese at Antigonish as well as consultation with a detailed history of the Catholic Church in Eastern Nova Scotia.²¹

Local residents also report that Martin Daly (likely the son of “M. Daley” (Michael) shown on Figure 3.2-3) and his son Vincent were the last residents of Black Point. In his later years, Martin lived at nearby Fox Island or Fox Island Main during the week, working as a fisherman. On weekends, he would return to Black Point to live with his son. The two were both farmers and fishermen, a type of dual employment that was not uncommon on the coast of Nova Scotia during the nineteenth and early twentieth centuries. Sometime after the 1930s, the Daley house was demolished, as presumably was the associated barn. Both were located in a meadow with a brook running down its centre, where one local resident reported pasturing his family horse in the summers.²²

Sometime after all of the residents of Black Point had moved to Fox Island Main or further afield, John Rhynold and his son reportedly flew a flag on Black Point in memorial to John’s mother, who was born at Black Point.²³ Additionally, a descendent of the Lukeman family kept a cabin on his family property at Fogherty Head, and used to visit the site each year.²⁴

Review of aerial photographs held at the Nova Scotia Department of Natural Resources show what appears to have been a roadway between the Fogarty side (west) and the Lukeman side (east) of Fogherty Head visible in 1943 (Figure 3.2-6). The road is still visible in 1954, as well as a small shadow that may have represented one of the houses within the study area (Figure 3.2-7).

3.2.3 Fogarty Family History (Spellings FOGARTY, FOGERTY, FOGHERTY, FOGATI)

In 2014, a descendant of Michael Fogarty came forward with additional oral history regarding Fogherty Head, as well as photographs of one of three house foundations known to the family at this location (Figure 3.2-8). Mr. Fogarty indicated that from 1820 to 1928, the Fogarty grant was home to four generations of the family, while he and his living relations comprise the seventh and eighth generations. The Fogarty family indicates that approximately 120 births occurred on the granted lands.²⁷ However, a review of available vital statistics records online indicates less than a dozen Fogarty births at Black Point, and no deaths or burials, most of these incidents seeming to have occurred nearby at Fox Island Main, Half Island Cove, Hazel Hill, or Canso.

The available vital statistics records should by no means be considered a complete index of all births, marriages, and deaths, but it does provide a sizeable sample from which to estimate the level of activity in the area. Based upon this information, it appears likely that the Fogarty family had a small but historically very notable presence on their granted lands at Fogherty Head.

Mr. Fogarty also provided the following family history regarding the grant:

On, or around 1890, Joseph Fogarty, 9th child of Mickal (2nd generation inhabitant), began a fishing operation at Fogarty's cove. He was joined in this pursuit by his sons and, after death; it was continued by his son Vincent and Vincent's sons. This operation continued long after the Fogarty's [*sic*] moved their home to Hazel Hill (1928). The land however was never abandoned. Vincent and his sons would commute to the site. Some extended periods of time would be spent living in Fogarty's Cove while fishing. By the late 1800's, the area had a school and a church. The church burnt down c. 1930's, resulting in the loss of all records.²⁸

This pattern of habitation and gradual withdrawal appears to have been echoed by the Daly and Lukeman families on the other side of Fogherty Head, as indicated by other oral history accounts presented above. It appears most likely, as noted above, that both the school and the church were located outside the study area, at or near Fox Island Main to the east.

²⁷ Fogarty 2014:6.

²⁸ Fogarty 2014:6.

Figure 3.2-8: A photograph supplied by Frank Fogarty of one of the foundations at Fogherty Head. Note the distinct metal fragment inside the cellar (blue), which allowed the archaeological team to confirm that this cellar is one of those identified during the reconnaissance as belonging to the Daly family.

Finally, Mr. Fogarty indicated that the family was aware of three foundations of “original dwellings,” and he also reports that the family believes it likely that burials occurred on the property, “given the poverty and distance to Canso.”²⁹ While this information as presented appears speculative rather than concrete, the family was also able to provide specific locational information on both the foundations and the probable burial site (Figure 3.2-9). Both of these locations were investigated during the field reconnaissance, with the results presented in section 3.3 below. Additionally, Brian Fogarty indicated that there is an oral account of wooden crosses observed in the mid-twentieth century, and additionally a beach rocky east of the study area is the reported source of stones used as rough headstone markers. Neither crosses nor stone markers were observed during the reconnaissance.³⁰

Note that the map has been turned sideways; north is to the left. Courtesy Frank Fogarty.

3.2.4 Daly Family History (Spellings DAILY/DALY/DALLY/DALEY)

The Nova Scotia Historical Vital Statistics, an online database of birth, marriage and death registration, as well as census records and the online parish records of St. Ann Church, Guysborough, were searched in an effort to construct a detailed genealogy of the Daly family. Additionally, these records can provide information about residence of family members at the time of events such as births, deaths and marriages.

Unfortunately, the census data for the area can be scarce on details and the only census with a specific address listed for each entry is the 1911 census. Multiple spelling variations are found throughout the consulted archival material. For ease of reporting, one spelling will be used consistently throughout, which may not reflect the spelling within specific documents.

Lawrence Daly first appears in archival documents in 1829, when he is listed as a sponsor for the baptism of Elizabeth Dobbins. This baptism took place at Black Point.³¹ Historically it was not uncommon for baptisms to occur at home rather than in a church or chapel.

³¹ St. Ann Parish Records Book 1 Baptisms 1829-1831 page 41 no 580.

Just a few years later, he appears again in the baptismal records. This time, he is the parent of Mary Daly, 12 months old, who is baptised at Black Point in 1833.³² Lawrence and his wife, Elizabeth, appear three more times in the baptismal records for the baptisms of their children Michael in 1834, John in 1836, and Edward in 1839. The records of these baptisms do not explicitly state Black Point; in fact no location is given.³³

Based on marriage and census records, Lawrence and Elizabeth had at least six children: Mary born 1832, Michael born 1834, John born 1836, Edward born 1839, Johanna born around 1841, and Ann born around 1843. When Lawrence's employment is described, it is listed as fisherman. His place of birth is listed as Ireland.³⁴

Lawrence also appears in the 1861 census, the earliest census surviving for the area, in a household with four males and three females.³⁵ In 1865, Lawrence's death records indicate that he died at the age of 72 of consumption at Black Rock. He is described as a fisherman and a widower. His son Michael was the informant.³⁶

In the 1871 census, the single Daly household of 1861 has been split into two households occupying separate dwelling houses. Michael, now 43, is living with his wife Mary and one year old daughter Catherine. Michael is described as Catholic, Irish and a fisherman. His remaining unmarried siblings are listed in the next census entry, in a separate dwelling house. John, now 40, is listed as the head of the household, which contains Edward, age 38, Mary, age 45 and Johanna, age 30. Edward and John are both listed as fisherman.³⁷

Ann Daly, the youngest sibling, married James Eaton in 1868 at Black Point. Both Ann and James were living at Black Rock at the time of their marriage and James is working as a fisherman.³⁸ Ann and James appear in the 1871 census living in James' parent's household.³⁹ Several records of their children's births survive, including Bridget Ann Haden (*sic*, Eaton), born 1870 at Black Point,⁴⁰ James Edgar Eaton, born 1875 at Black

³² St. Ann Parish Records Book 1 Baptisms 1832-1833 page 190 no 69.

⁴⁰ Nova Scotia Historical Vital Statistics 1870 book 1808 page 108 no 35.

Point,⁴¹ and Lawrence Eaton, born 1875 at Black Point.⁴² Interestingly, in James' and Bridget's registrations, their father is listed as a fisherman but in Lawrence's registration, as a farmer. Ann and James appear in the 1881, 1891 and the 1901 census, living in the Crow Harbour polling district. By 1911, they have moved to Fox Island and are living near two of James Lukeman's children (Peter and Patrick) and close to Martin Daly, Ann's nephew.⁴³

James Edgar Eaton and Lawrence Eaton, both born in 1875, appear to have died young, as they are not found in the 1881 census or any later census. However, death registration records could not be located for either one, suggesting they may have moved out of the district and even out of the province.

Bridget married Murdock McNeil in 1891 at Black Point. At the time of their marriage, Bridget was living at Black Point, where she had also been born. Her parents are described as fishermen.⁴⁴ Lucy married Edmund Hurst in 1903 at Canso. Her place of residence and place of birth are both listed as Fox Island Main and her parents are described as farmers.⁴⁵ This may indicate that the family moved from Black Point sometime between Bridget's birth in 1871 and Lucy's birth in 1881. However, given that Bridget's marriage took place at Black Point, it seems more likely that the family moved to Fox Island between Bridget's marriage in 1891 and Lucy's in 1903.

Much of Ann (nee Daly) Eaton's family died of tuberculosis (TB). Ann and her son Alexander died of the disease the same year in 1911. Both were listed as living at Fox Island Main at the time. Alexander was single and working as a fisherman. He is listed as being born at Fox Island Main.⁴⁶ John died a few years later in 1917, also of TB. He was single, living at Hazel Hill and working as a labourer. His birthplace is listed as Hazel Hill.⁴⁷ Both Alexander and John's death registrations appear to have the incorrect birthplace. Bridget died of TB in 1912, while living at Canso.⁴⁸ Lucy also died of TB in Canso, in 1916. Her death registration lists her birthplace as Fox Island.⁴⁹ No death registration could be found for their father and Ann's husband, James Eaton.

⁴⁹ Nova Scotia Historical Vital Statistics 1916 book 38 page 492 no 915.

Michael's wife Mary was also an Eaton and was the sister of James. They were married one year after Ann and James in 1869.⁵⁰ Archival documentation indicates that Michael and Mary had three children: Catherine born 1869, Martin born 1871 and Stephen born 1873.⁵¹ Catherine and Martin's birth registrations list their place of birth as Black Point.⁵² No birth registration could be located for Stephen.

Catherine appears to have left the household by 1891, when she disappears from the census. No marriage or death records could be located for her. Martin was married twice. His first marriage was to Annie Walsh in 1903 and Martin is listed as a fisherman living at Fox Island Main but born at Black Point.⁵³ Three years later, Martin married Julia Haines in 1906. Their marriage registration lists Martin as living at Fox Island and also states he was born at Fox Island.⁵⁴ This contradicts his first marriage registration and his birth registration, which also lists his birthplace as Black Point. Martin and Julia appear in the 1911 census with four children, living at Fox Island.⁵⁵ Martin died in 1956 at Fox Island Main at the age of 85.⁵⁶

Stephen remained single and never married. He appears to have remained living in the family homestead with his parents and all three of them appear in the 1911 census as the only household in Black Point. At the time of the census, a young woman named Minnie Fogetary is also living with the Dalys. Stephen is listed as the head of household and works as a fisherman.⁵⁷

Michael died in 1916 at the age of 61. He is listed as living at Black Point at the time of his death.⁵⁸ His wife Mary died in 1929 at the age of 95. She is listed as living at Fox Island Main at the time of her death. Interestingly, she is described as living at the place of her death for 50 years.⁵⁹ Clearly there is some error or misunderstanding as this conflicts with the 1911 census and her husband's death registration in 1916. Stephen died in 1935 at the age of 61. He was living at Fox Island Main at the time of his death.⁶⁰

Again, his death registration lists him as living his whole life at Fox Island Main, something clearly contradicted by other archival documentation.

No grant or land papers were located for the Dalys at Black Point and it is possible that the lack of a Crown grant to land is behind the discrepancies in the 20th century documents. It is possible that the Daly grant, which is shown on Crown land maps as along the new Canso Road, is shown in error or perhaps more likely, the Dalys may have opted to settle near the shore rather than farther inland.

Lawrence's unmarried children continue to live together in the same dwelling until 1896, when Mary Daly marries George Rhynold. At the time of her marriage, Mary was 57 years old and a spinster. Both are listed as living in Black Point at the time and Mary is listed as born at Black Point.⁶¹ The A.F. Church map (Figure 3.2-3) depicts a home belonging to G. Rhynold inland from the study area, along the new Canso Road.⁶² It is possible that this is the same G. Rhynold whom Mary Daly married.

By 1901, Mary is widowed and living with her brother, John, a fisherman. However, she is listed as the head of the household. Johanna, their sister, appears to be living with Ann Daly and James Eaton. Edward, the remaining Daly sibling, does not appear in the census for this area.⁶³ His death registration indicates that he was living in Canso from the 1890s until his death in 1921 and working as a labourer.⁶⁴ The 1891 census shows Edward living with his wife, Mary and children Lawrence and Mary near his siblings, in the Crow Harbour polling district. He also appears in the 1901 census, this time living in the Cape Canso polling district.⁶⁵ Further examination of the archival record identified the marriage registration of his daughter, Margaret C. Daly who married John Patrick Kennedy (descended from Thomas Kennedy and Mary Lukeman) in Canso in 1912. Their marriage registration indicates that she was born in Canso around 1895.⁶⁶

The household of unmarried and widowed siblings does not appear in the 1921 census. John Daly died in 1915, single and living at Half Island Cove at the time of his death.⁶⁷ Mary died in 1924, also living at Half Island Cove at the time.⁶⁸ While John's death registration lists his place of birth as Black Point, Mary's list her birthplace as Fox Island. There are several other errors in Mary's registration, however, including being listed as

English and married, instead of Irish and widowed. No death registration could be located for Johanna.

See Appendix B for a family tree compiled during this research.

3.2.5 Lukeman Family History (Spellings LUKEMAN/LOOKMAN/LUFEMAN/LUIKMAN/LOUGHLIN)

The Nova Scotia Historical Vital Statistics, an online database of birth, marriage and death registration, as well as census records and the online parish records of St. Ann Church, Guysborough, were searched in an effort to construct a detailed genealogy of the Lukeman family. Additionally, these records can provide information about residence of family members at the time of events such as births, deaths and marriages. Unfortunately, the census data for the area can be scarce on details and the only census with a specific address listed for each entry is the 1911 census. Multiple spelling variations are found throughout the consulted archival material. For ease of reporting, one spelling will be used consistently throughout, which may not reflect the original spelling within specific documents.

James Lukeman Senior and his wife Sara first appear in archival documentation in 1830-1831, when they are listed as the witness to the marriage of John Downey and Margaret Lukeman.⁶⁹ Margaret is probably their daughter, although this is not explicitly stated in the record. Several other Lukeman marriages occurred in the 1830s. Thomas Kennedy married Mary Lukeman in 1832,⁷⁰ James Murphy married Margaret Lukeman in 1835⁷¹ and James Lukeman married Mary Eaton in 1836.⁷²

These Lukemans are probably all children of James and Sara. This is speculation and could not be confirmed due to scarcity of records, particularly of death records. However, the relationships between these four families (Downey, Kennedy, Murphy and Lukeman) can be seen in the witnesses to their marriages and sponsors for the baptisms of their children, in which they figure prominently. For example, James Lukeman and Thomas and Mary Kennedy were the witness to James and Mary Murphy's marriage in 1835. Additionally, both Margaret Murphy (nee Lukeman) and Mary Kennedy (nee Lukeman) are listed in the censuses as being born in Newfoundland, as is James Lukeman in some of his children's death registrations.⁷³

⁶⁹ St. Ann Parish Records Book 1 Marriages 1826-1831 page 298 no 13.

⁷⁰ St. Ann Parish Records Book 1 Marriages 1826-1831 page 297 no 6.

⁷¹ St. Ann Parish Records Book 1 Marriages 1826-1831 page 288 no 15.

⁷² St. Ann Parish Records Book 1 Marriages 1826-1831 page 285 no 1.

⁷³ 1871 Census Nova Scotia Guysborough, Crow Harbour page 37 no 110; 1881 Census Nova Scotia Guysborough, Cape Canso page 32 no 130; Nova Scotia Historical Vital Statistics 1922 book 68 page 522.

James Lukeman Senior and his wife do not appear in any censuses. Unfortunately, the death records among the St. Ann Parish records are quite sparse and death records could not be located for James or Sara. It is likely that they died prior to the census of 1861.

The Downy family also disappears relatively quickly from records of the area. A baptism record in 1832 indicates they had at least one child, a daughter named Catherine.⁷⁴ No other records of births, marriages or deaths could be found for the Downeys or their daughter.

Thomas Kennedy and wife Mary Lukeman appear more often in the records and the baptisms and births of five of their children were located. Mary Ann was baptised in 1833,⁷⁵ followed by James in 1837,⁷⁶ Catherine in 1839,⁷⁷ Patrick in 1844,⁷⁸ and finally Thomas in 1848.⁷⁹ Thomas' baptism record contains Canso Harbour written above the entry. This may be an error since the family does appear in the 1861 census in the Black Point area. Thomas Kennedy is listed as the head of the household with five males and two females.⁸⁰

By 1871, Thomas appears to have died and Mary is listed as the head of the household and a widow at 59 years of age. She is living with her daughter Mary, age 37, and two sons Thomas and John, ages 23 and 21.⁸¹ By 1881, the family disappears from the Black Point area. Mary Kennedy can be found in the household of her son, John with his wife Margaret and their five children. They are living in the Cape Canso polling district where John is working as a fisherman.⁸² Mary does not appear in the 1891 census.

John Kennedy married Margaret Ryan in 1873. Both John and Margaret were living in Canso at the time of their marriage but the registration notes that John was born at Black Point. John was working as a fisherman.⁸³ John and Margaret had a large family, reflected in the censuses from 1881 to 1911, which all place the family in Canso.⁸⁴ One

⁸⁴ 1881 Census Nova Scotia Guysborough, Cape Canso page 32 no 130; 1891 Census Nova Scotia Guysborough Cape Canso page 27 no 121; 1901 Census Nova Scotia Guysborough Canso West page 1 no 1; 1911 Census Nova Scotia Guysborough Canso Town (North) page 13-14 no 134.

of John's children, John Patrick Kennedy, married Margaret Daly in 1912 in Canso.⁸⁵ Margaret's father, Edward Daly, was also from Black Point and moved to Canso in the 1890s. John Kennedy died in 1932 in Canso.⁸⁶

A death registration was also located for Mary Ann, the eldest Kennedy daughter. She died in Canso in 1875, possibly suggesting the family had moved from Black Point to Canso by this date. Her place of birth is listed as Canso, which may be an error.⁸⁷ Thomas and Mary Kennedy's remaining children (James, Catherine, Patrick and Thomas) disappear from the archival records. Catherine does not seem to have been counted in the 1861 census, although all of her brothers were. Ten years later, only John and Thomas are listed in census.⁸⁸ No marriage registrations or death registrations could be located for any of the siblings, aside from John and Mary Ann.

James Murphy and his wife Margaret Lukeman also have a presence in the archival record that suggests they lived at Black Point during at least part of the 19th century. They had at least five children including John, baptised in 1839⁸⁹ and James baptised in 1846.⁹⁰ They appear in the 1861 census as James Murphy, with a household of two males and one female. In the 1871 census, however, James Murphy appears to have died and his son John is the head of the household. Margaret appears, age 57, as do three daughters: Mary (age 30), Alice (age 27) and Bridget (age 22).⁹¹

In the 1881 census, most of the Murphy family has disappeared. Daughters are often difficult to trace due to their changing name if they married and the three Murphy daughters could not be identified in any further censuses, nor could a marriage or death registration be located for any of them. A Mary Murphy of the right age was located in the 1881 census in Canso working as a servant. Although she is Catholic and Irish, there is not enough identifying information to conclusively identify her as the daughter of James and Margaret Murphy.⁹² Margaret Murphy (nee Lukeman) has also disappeared by 1881 and a death registration could not be located for her either. Her son James Murphy was not listed in any census and the only archival record that could be located for him was his baptism in 1846.

⁹¹ 1871 Census Nova Scotia Guysborough Crow Harbour page 37 no 110.

⁹² 1881 Census Nova Scotia Guysborough Cape Canso page 30 no 120.

John Murphy was found living in the Cape Canso polling district in 1881, along with his wife Jane and son George, age 7. Jane is noted as French in the census. Their neighbour is Patrick Lukeman, John's cousin.⁹³ John and Jane had two children, George (born ~ 1873) and Katherine (born ~1885). Katherine appears only in the 1891 and 1901 censuses and no marriage or death registration could be located for her.

George Murphy married Julia Boudreau sometime prior to the 1901 census, where he appears to be living with Julia next door to his parents and sister, in the Cape Canso polling district.⁹⁴ In 1911, George Murphy's household had dramatically expanded. In addition to five children, his widowed mother Jane and her adopted son Charles are also living with George. This large family is living at Fox Island.⁹⁵ His father, John, had died in 1908 at Fox Island Main. John's death registration lists Black Point as his birthplace.⁹⁶

George and Julia had a large family and between the census data and birth registrations, ten children were identified. George's place of birth is given in some of his children's birth registrations. However, it is often contradictory. Laurier Murphy's birth registration states George was born at Harbour a Bouche, Antigonish County.⁹⁷ Robert Murphy's birth registration states Fox Island Main⁹⁸ and Anna Murphy's lists Black Point at George's place of birth.⁹⁹

In 1921, George is widowed and living with his seven surviving children. His wife died in 1917, while living at Fox Island Main.¹⁰⁰ His mother, Jane, is now living alone next door.¹⁰¹ George remarried in 1923 to a widow, Elizabeth Ryan, and in marriage registration lists Fox Island as both his place of birth and the birthplace of his father, John.¹⁰² This is probably an error since John seems to have lived at Black Point until the mid 1870s. George died in 1958 at the age of 85. He was living at Fox Island at the time of his death.¹⁰³

James Lukeman married Mary Eaton in 1836. They had eight children: Bridget born 1838, John born 1841, Thomas born 1844, Patrick born 1846, Margaret born 1848, James or Joseph born 1850, Mary born 1854 and Peter born 1856. Baptisms and marriage records

for John, Thomas, Margaret and James indicate that they were born at Black Point.¹⁰⁴ James Lukeman appears to have died prior to the 1861 census, where Mary Lukeman is listed as a widow and the head of a household with four males and two females.¹⁰⁵

By 1871, most of the Lukeman's children have left their household. Mary is still shown as the head of the household and is living with Patrick, Peter and Mary. Thomas and his wife Elizabeth are also living at home, with their two young children, James and Mary.¹⁰⁶

Of James and Mary's other children, there was little archival material available, particularly birth, marriage and death registrations. Therefore, this research was heavily reliant on census information. Overall, no trace could be found of their three daughters. No marriage or death registration could be located for Bridget, Margaret or Mary and they could not be located in any censuses. Their son James or Joseph, whose baptism records place his birth at Black Point, could also not be located further in the archival material.

By 1881, Peter Lukeman is listed as the head of the household at Black Point, with his mother Mary and a servant, Mary Eaton. He is working as a fisherman.¹⁰⁷ Peter married Johanna Cavanagh in 1883. Their marriage registration states that both Peter and Johanna were born at Black Point and that they are currently living there.¹⁰⁸ By 1891, the family has disappeared from Black Point completely, suggesting that they left between 1883 and 1891.

Mary Lukeman appears to have died before the 1891 census, although no death registration could be located for her. Peter can be found in the Cape Canso polling district living next door to his brother Patrick.¹⁰⁹ Patrick has been living in this polling district since the 1881 census, where he appears with his wife, Bridget and two sons. He is living next door to his cousin, John Murphy.¹¹⁰ Bridget is Johanna Cavanagh's sister and she married Patrick in 1876. Their marriage registration states that both Bridget and Patrick were born at Black Point and are currently living there.¹¹¹ This suggests that

Patrick left Black Point between 1876 and 1881, when he appears in the Cape Canso polling district.

Peter and Patrick also appear in the 1901 and 1911 censuses as neighbours. According to the 1911 census, Peter and his family are living in Fox Island, next door to Patrick's son William. William is living with his wife, three children and his elderly father Patrick.¹¹² Peter died in 1922 at Fox Island. His registration lists that he had lived at Fox Island his entire life, which is contradicted by census information and his marriage registration.¹¹³ No death registration could be located for Patrick.

James and Mary's oldest son John was married in 1871 to Elizabeth Kennedy. At the time of their marriage, John is listed as living at Black Point, where he was born.¹¹⁴ By 1881, however, he has moved to Guysborough and appears with his wife in the 1881, 1891, 1901 and 1911 census.¹¹⁵ John did not appear to have children. His death registration indicates that he died at the age of 76 in Guysborough.¹¹⁶

Their second oldest son, Thomas, was living at Black Point 1871 in his mother's household with his wife, Elizabeth Self and two children. Thomas and Elizabeth married in 1868 and their marriage registration lists them both as born and currently living at Black Point.¹¹⁷ By the time of the 1881 census, however, Thomas and his family appear to have moved. They are counted in the Cape Canso polling district in both 1881 and 1891.¹¹⁸ By 1901, Thomas' eldest son, James, is living next door to his parents with his wife and young family in the Canso West district.¹¹⁹ In 1911, Thomas and Elizabeth are living with James and his family at Hazel Hill.¹²⁰ Thomas Lukeman's 1930 death registration lists Hazel Hill as his residence and notes he has been living there for 30 years.¹²¹

The Lukeman family, as well as the Kennedy and Murphy families, appear to have lived at Black Point during the 19th century. It difficult to tell when these families first arrived

at Black Point as early archival material, such as baptism records, often do not include a location. It is easier to pin point when the families left Black Point. The Kennedys seem to have moved to Canso in the 1870s. The Murphys also seem to have left in the 1870s, although went only as far as Fox Island Main. The Lukemans had several sons who left for places like Guysborough, Hazel Hill and Fox Island during the 1870s and 1880s. The last Lukemans probably left Black Point between 1883 and 1891.

Although they might have left Black Point, many of these families settled in communities with other Black Point descendants close by. For example, in the 1911 census, George Murphy (James Murphy and Margaret Lukeman), Martin Daly (Michael Daly and Mary Eaton), Peter and Patrick Lukeman (James Lukeman and Mary Eaton) and James and Ann Eaton (nee Daly) are all close neighbours at Fox Island.¹²²

See Appendix B for a family tree compiled during this research.

3.3 Field Reconnaissance

A field reconnaissance was conducted by Laura de Boer and Courtney Glen in early October 2014. Unlike the 2011 reconnaissance which accessed the barrens from the south, access to the outflow from Fogarty Lake as well as to the Fogherty Head lowland was achieved by following a very rough and overgrown ATV trail east from the end of Half Island Cove Road across the granite barrens. The team then used the eastern cutline of the former Fogarty grant to climb down the steep escarpment between the granite barrens and the coastal lowlands that were of prime interest during this reconnaissance. The reconnaissance was aided by a hand-held GPS unit as well as LiDAR data provided by SLR Consulting. Results are indicated on Figure 3.3-1 as well as detailed maps throughout this section.

The eastern extent of Half Island Cove Road, though no longer driveable by car, was clearly a substantial roadway at one time and most likely represents a portion of the Old Canso Road shown on historic mapping. The presence of a corrugated steel culvert (20 T 642948 5023626, NAD83) on the road towards the study property indicates that road improvements have been made in the later half of the twentieth century. However, upon crossing a small brook (20 T 643109 5023566) (Plate 1) the road abruptly and dramatically changes into a rough and undulating ATV trail unsuitable for car or even cart travel. Rhodora and moss overgrowth punctuated with sections of spruce-dominated forest has obscured any sure sign of the Old Canso Road beyond this point, although it seems likely that the ATV trail that extends towards Canso from this point may at some locations intersect or travel along the historic roadway. In some areas where mud was exposed in low areas of the trail, animal tracks were observed,

¹²² 1911 Census Nova Scotia Guysborough Hazel Hill page 11 no 108-116.

dominated by deer but also including a small bear track. Coyote scat was observed throughout the study area.

In multiple locations a low, wet area or a steep rock escarpment had been made more traversable by the addition of fallen logs to create a short corduroy road (20 T 644336 5023751, 20 T 644402 5023791, among others) (Plate 2). While this technique is historical in nature it is unlikely that these short sections represent the original corduroys that would most likely have been found along the Old Canso Road. Similarly, in some locations loose stone has been used to build rough causeways over wet ground (20 T 643182 5023575) (Plate 3), but it is unclear whether this is historic or modern activity. A rough ATV bridge of spruce rails was observed spanning part of the outlet from Fogarty Lake (20 T 643982 5023670) (Plate 4), which was found to be little more than a trickle of water with a surrounding wet corridor some 5m wide.

Although on the way to the lowland the team examined the few instances of exposed granite for signs of petroglyphs, none were observed (Plate 5). In fact, the only exposures of granite on the barrens appear to be caused by ATV activity in the past several decades scraping the vegetation from the stone, where it is slow to regenerate. It appears likely, therefore, that any petroglyph creation in this area would have necessitated not only a steep and dangerous climb from the water or the lowlands, but also the activity of scraping away 10 to 30cm of moss, rhodora, and other vegetation to create petroglyphs, which within a few decades would likely have been re-covered without continued maintenance.

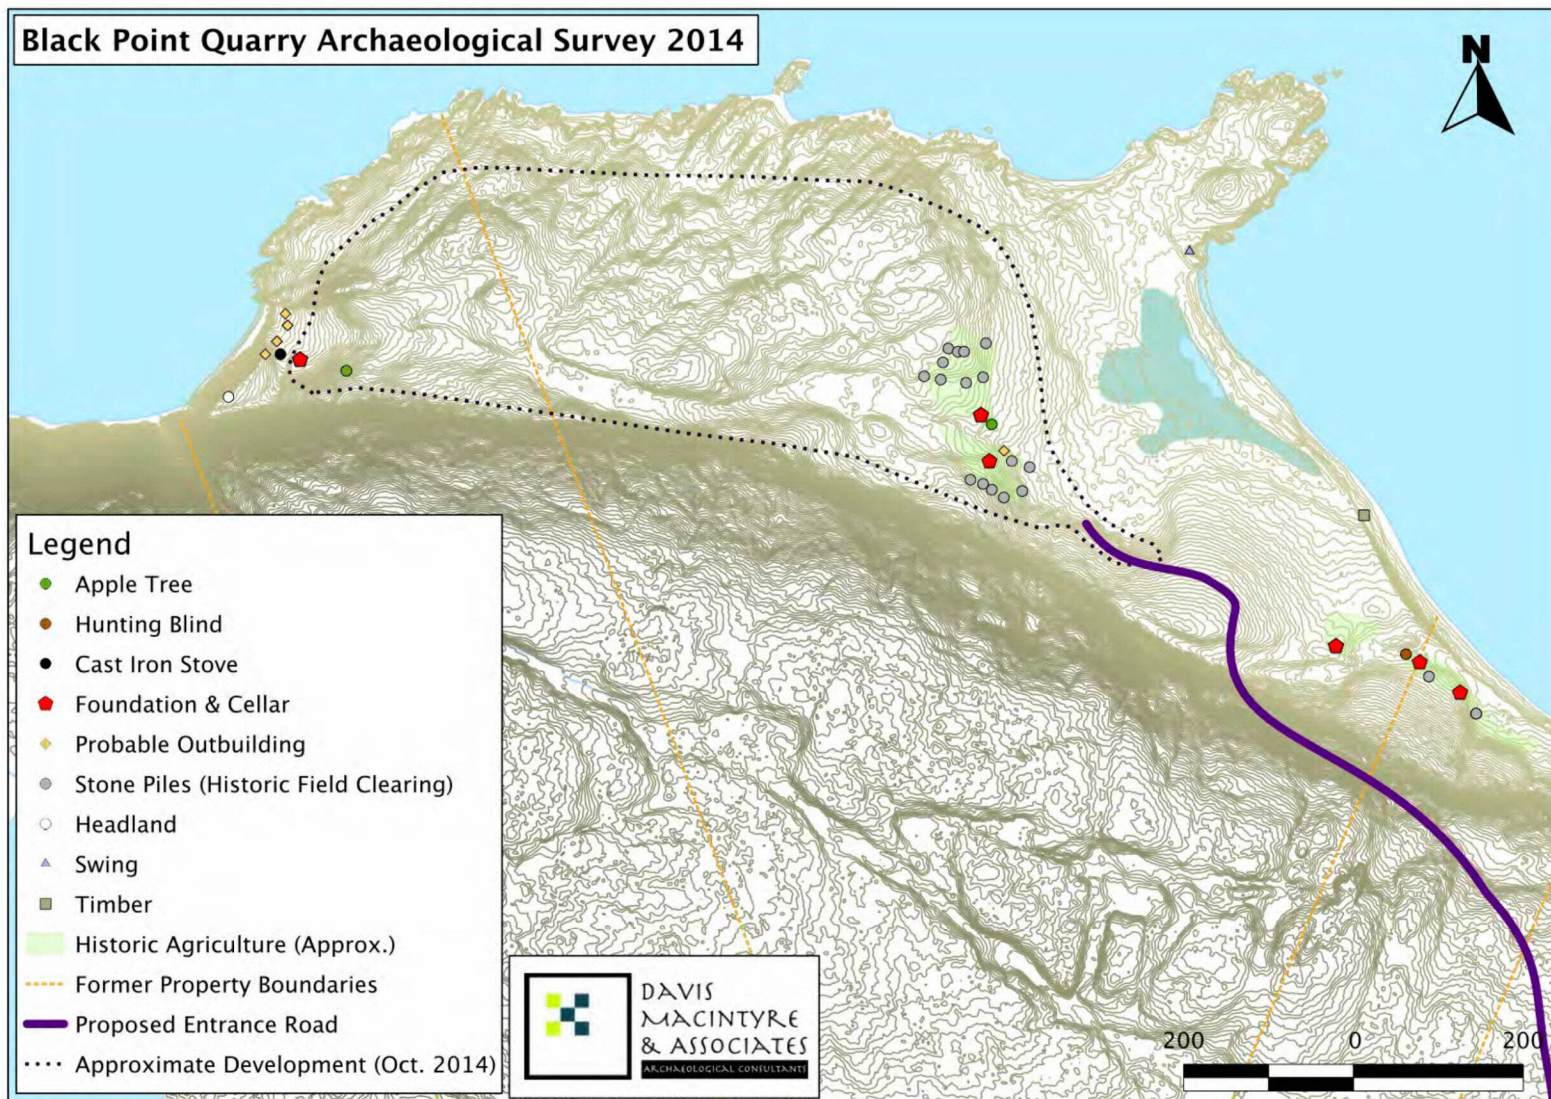

Figure 3.3-1: A map showing 2014 reconnaissance findings at Fogherty Head. Please note that the elevation lines shown are drawn from LiDAR survey data, courtesy SLR Consulting.

With the exception of the corduroy road elements and the trail itself, the granite barrens in this area appear to have been even more untouched by cultural activity than the areas examined during the 2011 survey. Upon reaching the cut line that would lead down to the lowland, the team found that the signs of heavy equipment observed in 2011 were still present along the cutline and extending to the northeast towards the edge of the barrens. Following the cutline, the team made the steep climb down to the lowlands and continued to follow the line to the rocky coast.

With an awareness of the early European fishing history of the Canso area along with the possibility of First Nations encampment and resource use along this shore, the team walked the full extent of the lowland shoreline, watching for any signs of fishing rooms or other historic activity as well as any areas suitable for First Nations encampment. It was found that the shoreline is dominated by sharp bedrock outcroppings of Lower Cambrian Metamorphic Slate and Quartzite, which fractures in blocky patterns that do not provide an appealing surface for petroglyphs nor a surface upon which cut or drilled post-holes for fishing stages can be easily seen (Plate 6). Most of the rocky outcroppings rise at least two to three meters above the high tide mark along the northern face of Fogherty Head. While aesthetically very beautiful, this shoreline is very treacherous both for habitation and for bringing small boats ashore where they could easily be smashed against the rocks (Plate 7).

Tucked against the steep bedrock outcroppings are small areas of high-energy cobble beaches sloping steeply into the water, indicating a possible rip tide (Plate 8). The bedrock framing these beaches has been beaten smoother by waves and cobbles in the intertidal zone. Although careful examination was made of these beaches, almost all cultural material was modern plastic, with the exception of an iron object that may have functioned as a net weight or some kind of cast iron base, observed near the cut line that was used to access the shore (Plate 9).

Against the cobble beaches in at least two notable locations, the bedrock exhibited natural faults extending inland, providing what seemed to be a more inviting path to access the land from the water (Plate 10). However, these sheltered lower areas were found to be soggy and wet, while the higher ground to either side is extremely rough and densely covered in vegetation and storm deadfall, making what may initially have appeared an inviting camp location into an inhospitable cove.

Black Point itself, protruding northeast from Fogherty Head, incorporates on its northwestern side a broad cove with a cobble beach backed by level ground that is more suitable for encampment, particularly by First Nations groups (Plate 11). However, the point is beyond the proposed impact area and in fact has remained reserved as Crown land. This location was encountered while the team was seeking a suitable crossing to the eastern shore of Fogherty Head to return to the study area. Its suitability for short-term encampment even in modern times was visible by a scattering of modern beer bottles visible just above the beach (20 T 645373 5024284) (Plate 12). The beach

itself was carefully examined for signs of archaeological material, but none was encountered (Plate 13). It should be noted that quartz cobbles suitable for use in lithic tool manufacture were present all the way around the study area's shoreline, originating from quartz veins in the local bedrock. No signs of worked quartz could be found.

Along the eastern shore, other signs of modern recreation were present, including a wood and rope swing hung from a tree (20 T 645465 5024223) (Plate 14) as well as an overgrown ATV trail most likely leading from Fox Island Main just above the shoreline. A very broad cove with a cobble beach takes up the entire eastern shoreline of the study area (Plate 15), fronting against a barachois along its northern half and a tall erosional face to the south. The Crown marker post marked on survey plans as positioned 63 feet (19m) inland was found loose on the beach, indicating either extreme storm activity or vandalism in its removal (Plate 16).

The beach itself is, like the smaller beaches to the north, very steep and shows signs of high-energy wave action. The small open barachois is fresh water, sloping gently up into a very large area of rough wetland (Plate 17). Coyote and deer tracks were observed in the mud exposed as the barachois dried out, while the beach-facing side of the barachois has been completely edged in cobbles from the storm beach as well as wild cranberry plants (Plate 18). The team swept the beach for signs of archaeological material, but none was present. It appears likely that the beach experiences regular overturning of its stones during every storm surge.

Beyond the barachois as the team continued south along the shore, the land above the beach rises dramatically to produce a sloped erosional face of soil rather than bedrock (Plate 19). All exposed soils were examined, but beyond modern beach debris the only cultural material observed against or in the erosional face was a square-cut timber approximately 4"x4" protruding from the bank (20 T 645671 5023912) (Plate 20). The timber may represent the remnants of a small wharf, but in the absence of any other timber nearby or any signs of cultural activity on the shore above the timber, it appears more likely that it is an isolated fragment, perhaps related to signage or a hunting blind.

Upon reaching the southern edge of the study area's shoreline, the team proceeded inland onto what had previously been the historic Lukeman family grant. It was found that a thin strip of high ground lay between the shore and a low, wet area running parallel to the beach. Just inland from this, the team began to observe signs of historic agricultural activity in the form of smoother topography, with forest dominated by mature spruce rather than scrub hardwood, and several piles of stones most likely resulting from historic field clearing (20 T 645803 5023678). Within this agricultural area, the team identified two stone-lined cellars with the stone outline of a foundation around each (20 T 645784 5023703, Lukeman Homestead 1, and 20 T 645736 5023739, Lukeman Homestead 2) (Plates 21 and 22 and Figure 3.3-2), and a third cellar and foundation of the same type just beyond the former Lukeman boundary (20 T 645638

5023758, Black Point Homestead 1) (Plate 23). All of the foundations are positioned on small rises or headlands on the suitable ground between the ocean shore and the steeper rise to the granite barrens behind them. The rotten remains of a modern hunting blind are also visible near the second of these foundations (20 T 645720 5023748) (Plate 24).

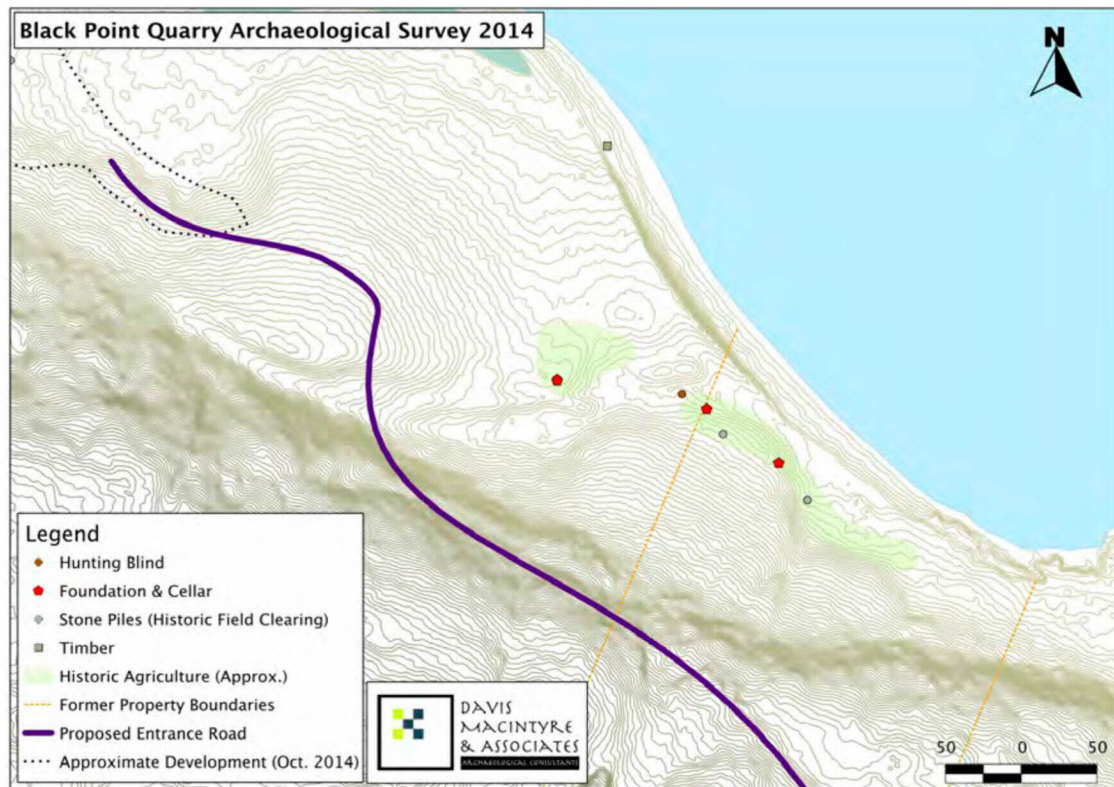

Figure 3.3-2: Detail of a map showing 2014 reconnaissance findings near the former Lukeman grant.

From here, the team proceeded northwest along an ATV trail, observing that the agricultural landscape quickly gave way to a rougher topography covered in dense undergrowth and deadfall. Nearly 400m from the previous agricultural area, stone piles and smooth topography were again noted. A fourth foundation (20 T 645230 5023976, Black Point Homestead 2) (Plate 25 and Figure 3.3-3), along with an earthen depression suggesting an outbuilding (20 T 645247 5023988) (Plate 26), were noted in the approximate center of this agricultural area, along with at least seven stone piles around the outer edges.

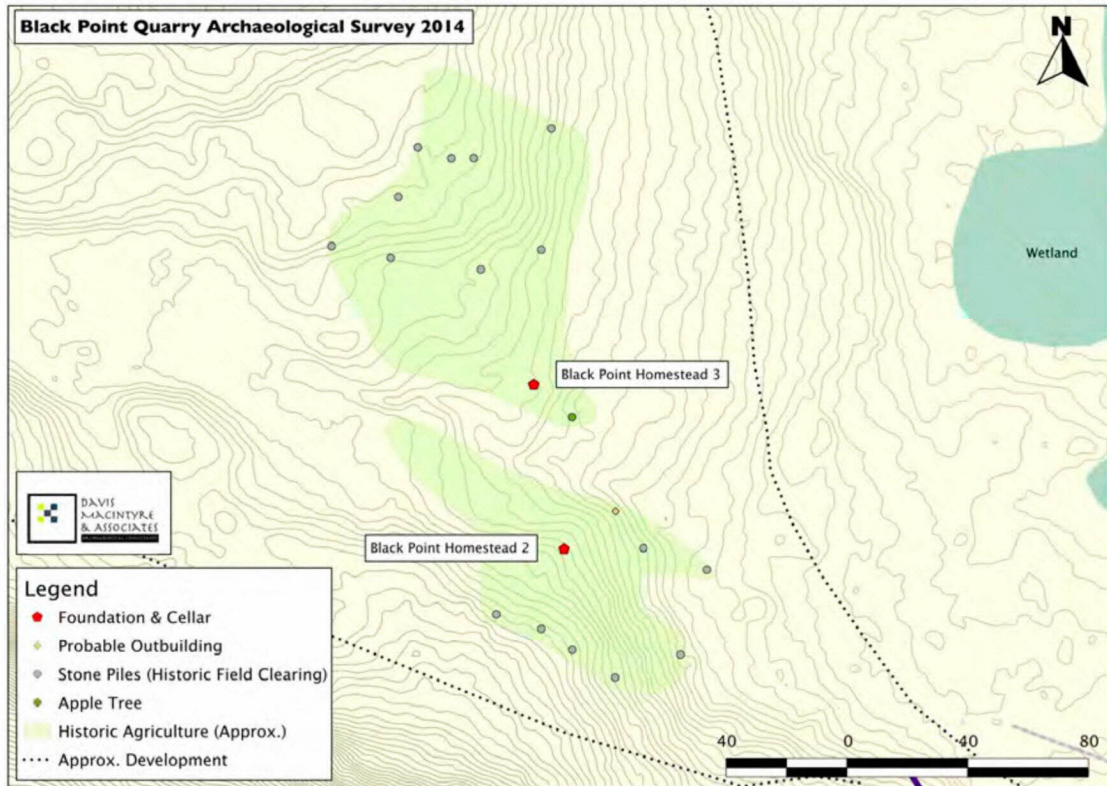

Figure 3.3-3: Detail of a map showing 2014 reconnaissance findings inland from the former Lukeman grant.

Crossing a very small stream, the team immediately encountered a mature apple tree and, proceeding onto the rising ground behind it, a fifth cellar and foundation (20 T 645219 5024030, Black Point Homestead 3) (Plate 27). Unlike the previous four foundations, which included a stone-lined cellar in the southern halves of each, this feature consists of a large rectangular foundation outlined in stone with a small cellar extending south from the middle of the southern wall. Further exploration of the surrounding area revealed that most of the agricultural landscape associated with this feature is found to the north, dotted with at least nine more stone piles.

Despite further examination of the surrounding landscape, the team was unable to locate any further signs of agriculture or any other archaeological features on this side of the headland. Proceeding north to the shoreline again, the team followed the open and rocky shore to the western side of the property, where the land had been previously granted to the Fogarty family.

Like the shore on the eastern side, again the rocky outcroppings and small cobble beaches gave way to a broader cove pressed against the higher cliffs of the granite barrens beyond (Plate 28). Above the cove, an open meadow slopes from higher, rougher ground down to the shore (Plate 29). Upon entering the meadow the team

found that much of the landscape is very wet, representing a broad, slow drainage from a low and wet area farther inland. Two large stone mounds were observed in the meadow (20 T 644400 5024150, 20 T 644403 5024136) (Plates 30 and 31 and Figures 3.3-4 and 3.3-5), one of which also included a historic brick and a fragment from a cast iron cook stove (Plate 32). Both mounds are broad and flat enough that they may represent footings for outbuildings or alternately small drying pads for processed fish. Neither was formally measured, but both are at least 3m x 3m in size and rise nearly 1m above the surrounding wet soil.

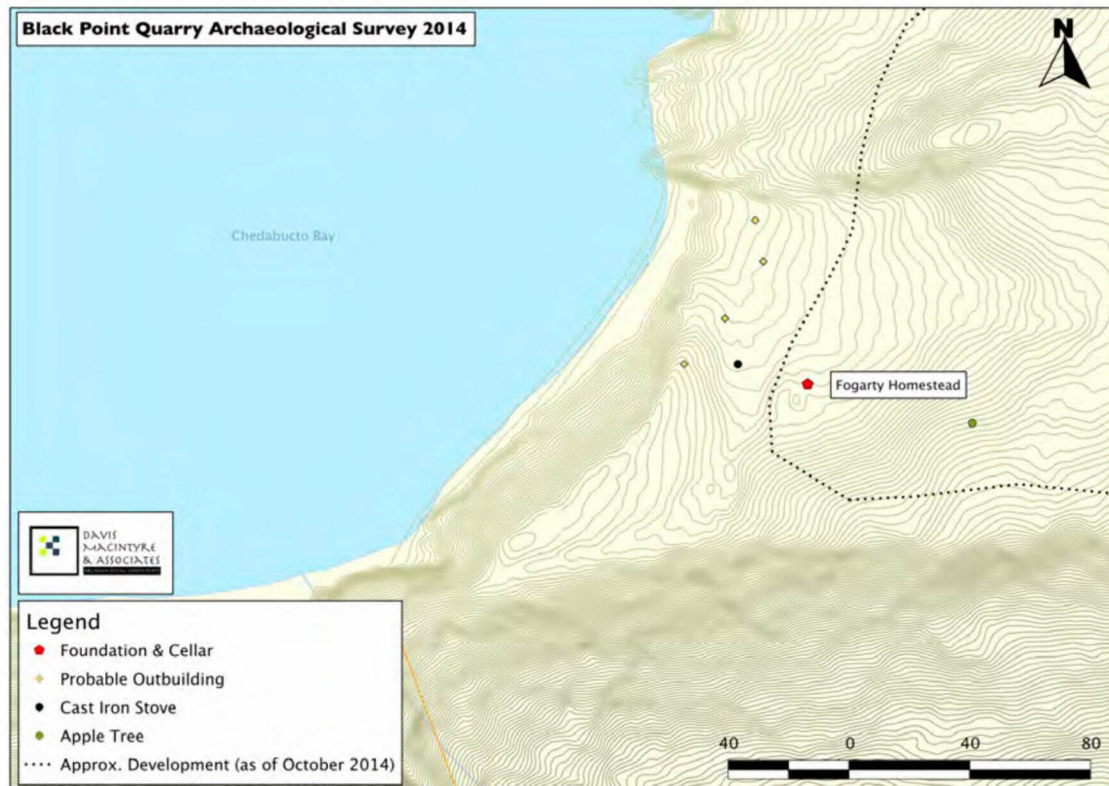

Figure 3.3-4: Detail of a map showing 2014 reconnaissance findings at the former Fogarty grant. Note that the Fogarty cellar is visible in the LiDAR data (shown here as elevation lines) as a small anomaly just below the red pin on this map. The slight discrepancy in location is due to hand-held GPS error, which can range up to 6m.

Examination of the edges of the meadow revealed few signs of cultural activity beyond the presence of some rose bushes, which had also been spotted along the rougher portions of the coast. The southern edge of the meadow, in contrast, included three historic features, along with an apple tree on higher ground overlooking the meadow (20 T 644472 5024082). Fortunately the team was able to reach the extent of the higher ground suitable for habitation before catching the heavy scent of a bear and moving on from the area.

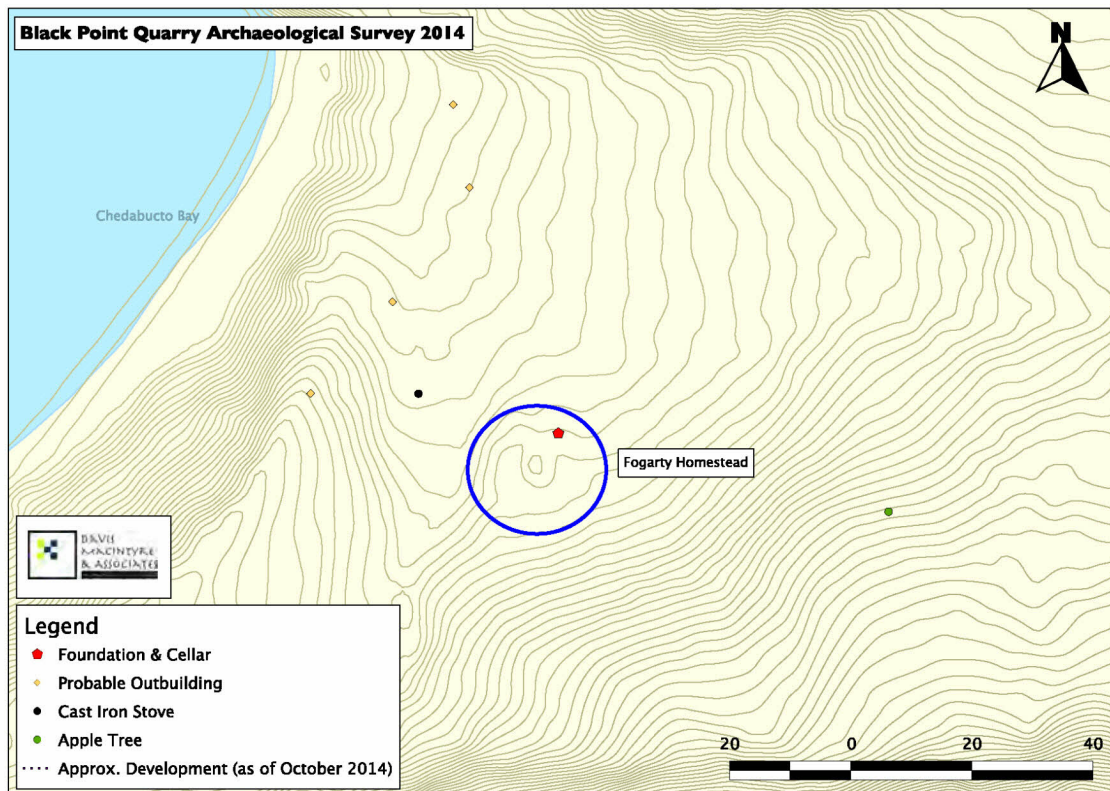

Figure 3.3-5: Closer detail of a map showing 2014 reconnaissance findings at the former Fogarty grant. Note that the Fogarty cellar is visible (blue) in the LiDAR data, shown here as elevation lines.

The largest of the historic features is a very deep stone-lined cellar (20 T 644417 5024095) (Plate 33), positioned within the meadow but near its edge and on higher, drier ground. The outline of this cellar is the only one of the six identified foundations that is visible on the available LiDAR data (refer back to Figure 3.3-4), most likely due to its depth and its position on more open and level ground than the other five. The surrounding soil is heavily overgrown, obscuring any foundation outline if there is one present. A rough open drain or entryway also appears to extend at least ten metres westward from the cellar. The feature is sheltered from the shoreline by a ridge of higher ground covered in spruce trees. Within the treed area, two more probable outbuildings were identified, the first a stone-lined depression (20 T 644390 5024117) (Plate 34) and the second an earthen depression built against the side of the hill (20 T 644377 5024102) (Plate 35).

A cast iron cook stove in pieces is visible on the surface between the cellar and one of the outbuildings. For the most part the stove is undecorated, but it does include the foundry marks "Record F & [Co.]" (20 T 644394 5024102) (Plate 36).

Proceeding uphill along the treed divide between the meadow and the shore, the team observed that the land eventually flattens into what would have been a scenic headland before the regrowth of spruce trees covered what appears to have been smooth agricultural lands (20 T 644333 5024052) (Plate 37). While the presence of burials cannot be confirmed or refuted at this stage, it is worth noting that this location is the most suitable for historic burial of all areas observed within the study boundaries, providing a scenic view of the sea and in proximity to historic settlement by the Fogarty family. It also corresponds to the area indicated by the surviving Fogarty family's oral history as the area where burials may have occurred (refer back to Figure 3.2-6).

4.0 RESOURCE INVENTORY AND EVALUATION

Six probable historic house foundations and five probable outbuilding foundations have been identified on the lowland of the study area, below the level of the granite barrens. Of these six houses, three are believed to be related to the extended Lukeman family, one to the Fogarty family, and two more to the Daly family. Maritime Archaeological Resource Inventory (MARI) forms for all six have been completed for submission to CCH and the Nova Scotia Museum.

The 1871 census lists the following six families: Michael Fogarty, Michael Daly, John Daly, Mary Lukeman, Mary Kennedy and James and Margaret Murphy. Based on the Church map (Figure 3.2-3) and the crown land grants (Figure 3.2-2), the census enumerator may have visited families along the old Canso road from the west to the east. This would place Michael Fogarty's house at the Fogarty end of the study area, with the two Daly households in the middle, which would match with the cellar features found and referred to as Black Point 2 and Black Point 3 (See sections 3.3 and 3.4 below).

Two more cellar features were found on land granted to the Lukeman family, with a third cellar located just west of the Lukeman grant (see sections 3.3 and 3.4 below). Since both Mary Kennedy and Margaret Murphy were originally Lukemans (probably sisters to James), it is possible that the cellar features on the Lukeman grant belonged to Kennedy and Murphy families. If the census enumerator did in fact travel west to east, the cellar at Black Point 1 may belong to James and Mary Lukeman, with Lukeman Homestead 2 belonging to Thomas and Mary Kennedy (nee Lukeman) and Lukeman Homestead 1 belonging to James and Margaret Murphy (nee Lukeman).

Lukeman Homestead 1 and Lukeman Homestead 2 are both positioned along the coastal portion of what was originally the land granted to Peter James Lukeman. Black Point Homestead 1, Black Point Homestead 2, and Black Point Homestead 3 are all located on ungranted land that was held by the Crown prior to plans to develop the Black Point Quarry. Black Point Homestead 1 is located in close proximity to the

Lukeman homes and may have been built by a member of the Lukeman family expanding the family holdings.

The Lukeman Homestead 1 site includes a long narrow strip of agricultural landscape set against a sharper slope angled towards the barrens, along with at least one stone pile, and a house foundation of stone approximately 9m x 7m in size with a stone-lined cellar approximately 2m deep in its southern half. Based on documentary records, it appears likely that this house belonged to James and Margaret Murphy, nee Lukeman.

The Lukeman Homestead 2 site includes a house foundation of stone approximately 10m x 7m in size with a stone-lined cellar approximately 1.5m deep in its southern half, and a possible collapsed drain extending eastward from the cellar. Twenty metres southeast, a pile of stones indicates some limited field clearing or possibly the footing of an outbuilding. The smoothness of the topography immediately surrounding the foundation also suggests limited field clearing and agriculture or animal husbandry. Based on documentary records, it appears likely that this house belonged to Thomas and Mary Kennedy, nee Lukeman.

The Black Point Homestead 1 site is a house foundation of stone approximately 10mx7m in size with a stone-lined cellar approximately 1m deep in its southern half. The smoothness of the topography immediately surrounding the foundation also suggests limited field clearing and agriculture or animal husbandry. The feature was very heavily covered with deadfall and organic debris, and so size estimates are very rough. Based on documentary records, it appears likely that this house belonged to James and Mary Lukeman.

Black Point Homestead 2 consists of a house foundation of stone approximately 8.5m x 6m in size with a stone-lined cellar approximately 1.5m deep in its southern half. The smoothness of the topography immediately surrounding the foundation also suggests limited field clearing and agriculture or animal husbandry. An earthen depression suggestive of an outbuilding and at least seven stone piles have also been recorded. Based on documentary records and oral history, it appears likely that this house belonged to Michael Daly.

Black Point Homestead 3 is a house foundation of stone approximately 8.5m x 9m in size with a stone-lined cellar approximately 1.5m deep, 3m wide and 3.5m long extending off the middle of the foundation's southern edge. The smoothness of the topography immediately surrounding the foundation also suggests limited field clearing and agriculture or animal husbandry. An apple tree and at least 9 stone piles have also been recorded. Based on documentary records and oral history, it appears likely that this house belonged to John Daly.

The Fogarty Homestead consists of a stone-lined cellar approximately 6m x 3.5m in size and 2m deep. The site is heavily overgrown, and so it is unclear if additional foundation

stones are located beyond the cellar's exterior stones. As many as four associated outbuildings have also been identified, one an earthen depression, the second a stone-outlined earthen depression, and two more near the shore of the cove are stone mounds that appear structural, one of which included a cook stove plate fragment and a historic brick. Fragments of a "Record F. & Co." cast iron cook stove are found on the surface less than 20m from the cellar, which dates approximately to a range of 1882 and 1947 (see below).

One member of the Fogarty family has indicated that he has spoken with a local resident who used the Lukeman property area and possibly the house remains as a hunting blind for many years.¹²³ The team intends to follow up with this oral history source prior to or during future archaeological mitigation at Black Point.

Table 1: Reconnaissance findings, coordinates, and estimated significance.

5.0 RESULTS AND DISCUSSION

The current development plan allows for an approximate 100m buffer between the recorded sites of Lukeman 1 and Lukeman 2 as well as Black Point 1. In addition, the proponent has indicated that avoidance of the Fogarty Homestead site will be possible with modifications to the proposed facility, although the changes have not yet been made.

Therefore, of the six archaeological sites recorded during this impact assessment, only two are expected to be impacted and most likely destroyed by the proposed development: Black Point 2 and Black Point 3. The Black Point Homestead 2 is of a similar style to Lukeman 1, Lukeman 2, and Black Point 1. Therefore, in the event of its destruction, it is believed that multiple examples of comparable sites will remain intact. The same is not true of Black Point 3, which is unique in layout compared to the other 5 foundations and indeed is not a layout that the team has encountered elsewhere in the past. The cellar of this foundation is positioned outside the southern wall of the main foundation, as if added after initial construction. While both Black Point 2 and Black Point 3 should be considered valuable archaeological sites, it is argued that Black Point 3 is of particular note and merits particular attention during the mitigation phase of this project.

In response to the discovery of a cast iron stove near the Fogarty cellar bearing foundry marks "Record F. & ...", the team briefly researched the stove company in an effort to date the artifact. It was found that the mark refers to the Record Foundry & Machine Company. Charles B. Record started a foundry business in Moncton in 1857 with George Scales as his partner. This company was known as the Moncton Iron Foundry. Upon Scales' death in 1858, Record took over the business.

Record's business was successful for a number of years until he turned the company over to the management of his son Edwin Albert Record and Robert F. Boyer in 1879. Boyer and Record made unwise contracts and ruined the company within two years. The business was sold to pay off creditors at auction in 1882 and Charles Record, who formed a joint-stock company in order to make the purchase, bought the physical foundry. This foundry was re-established as Record Foundry & Machine Company. Under Charles' direction, the company was successful and grew throughout the late nineteenth century.¹²⁴

A newspaper add from the 1947 indicates that the Record Foundry was still in existence at that time, operating under the name "Record Stove & Furnance [*sic*] Co."¹²⁵ It is unclear when the business named changed from Record Foundry & Machine Company. Therefore the date range for the cast iron stove fragment found at Black Point with "Record F. &..." inscribed is 1882 to 1947.

It is important to emphasize that although a Mi'kmaq presence along the Chedabucto Bay coast is well-known, there were no areas of elevated potential for First Nations archaeological resources identified within the study area. An area of moderate archaeological potential was identified outside of the study area on Black Point, but it is likely that the most suitable locations for encampment or other activities can be found to the east and west of the study area, at Half Island Cove and particularly at Fox Island Main where historic maps make note of "Indian Cove" at the outlet of a sizeable freshwater stream (refer back to Figures 3.2-3 and 3.2-4).

In contrast to these locations, very little of the study area is remotely suitable for the type of First Nations activity that would result in the creation of archaeological deposits. While the cobble beaches on the east and west sides of Fogherty Head would allow access by canoe to the land and resources, the extremely high-energy nature of the beaches and lack of suitable higher, drier ground adjacent mean that even if activity resulting in archaeological site formation had taken place on the beaches, they would quickly have been destroyed by the natural environment. At the cove on the western side, there are instances of somewhat level ground elevated from the cobble beach by

¹²⁴ Pincombe 1982.

¹²⁵ Cormier 2007.

only about 2.5 metres, making them perhaps the closest to suitable encampment areas within the study area, though still less suitable than the moderate potential area identified on Black Point itself. These areas included an extensive erosional face that upon careful examination yielded no sign of archaeological materials or soils. In addition, current development plans to not encroach upon these areas, and therefore despite being within the study area these sections are beyond the impact zone.

The remainder of the study area is notably inhospitable to encampment or even to general access without roadways: the granite barrens are extremely high and rough, while the northern shore of the low-lying Fogherty Head is dominated by sharp bedrock outcroppings that would be treacherous for canoe or boat access even on a calm day. It is possible that limited resource exploitation may have taken place, such as hunting or berry-picking at the barachois where cranberries were noted. None of these activities, however, would result in archaeological deposits of any note.

Addressing previous recommendations made in 2011, it has been determined that the historic Canso Road cannot be traced across the barrens due to their rough nature and extensive overgrowth, and it is unfortunately unclear at what point the road sloped off the barrens and down to the Daly and Lukeman Homesteads below. It is also unclear if anything more than a rough trail ever connected the Fogarty Homestead to this road, which was most likely efficiently accessed from the water rather than overland. The Ambrose Church map does seem to indicate that the Canso Road did somehow reach the lowland, however, in order to pass in proximity to M. Daly and Mrs. Lukeman's homes (refer back to Figure 3.2-3). In these areas, small sections of what appeared to be historic road were noted, but given that modern ATV trails appear to obscure and criss-cross these areas, they have not been formally marked due to doubtful identification.

Despite not being able to confirm a single continuous Old Canso Road, the team believes that they have identified all visible historic resources in proximity to the road, given that no signs of habitation can be found on the barrens and that the distinction between cultural and non-cultural topography on the lowland was found to be astonishingly distinct. While it is arguably possible that heavy deadfall and vegetation growth could have obscured additional features, a contingency plan has been put in place in the unlikely event that additional heritage resources are encountered during project construction (see section 6.0 below).

The 2011 impact assessment also recommended exploration of the Fogarty Lake outlet as well as the barachois on the eastern side of Fogherty Head. It has been found that the Fogarty Lake outlet is not only extremely small, but also that it appears to empty into the ocean from the top of a steep and inaccessible bedrock escarpment, visible on the right-hand side of Plate 28. The barachois, although of fresh water and perhaps inviting for visitation from the high-energy beach, grades upwards into marshy and very densely vegetated wetland, difficult to travel through for any reason. The problems of

archaeological deposits on the high-energy beach adjacent to the barachois have also been enumerated above.

6.0 RECOMMENDATIONS AND CONCLUSIONS

Potential construction impacts arise from removal of large quantities of fill and native soil, potentially unearthing, damaging, or destroying archaeological resources. In this case, six historic period archaeological sites related to early settlement have been identified, of which two are expected to be impacted by the development. The potential for First Nations archaeological resources has been determined to be low, though contingency measures will be in place to deal with the unlikely discovery of such resources. DM&A has completed an Archaeological and Heritage Resources Management Plan for the proponent, included here as Appendix C.

It is recommended that the three foundations at the east end of the property (the two on the former Lukeman property, and the third just beyond the western boundary on the former Crown parcel referred to as Black Point 1), as well as the foundation and four outbuildings on the former Fogarty property, be avoided by construction activities. It is recommended that these features be well flagged by an archaeologist and a 100 meter buffer be established around the features to ensure that their locations and boundaries are well-known and they are not disturbed during construction. It is also understood and recommended that the headland on the northwest end of the former Fogarty property that may be the location of reported historic burials will be avoided by construction. It is recommended that this area also be flagged and that the buffer zones for these resources be surveyed for future reference. The headland is approximately ten by 25 metres, though a more firm outline can be established on the ground during flagging based upon topography. It is recommended that the flagging be removed after construction so as to avoid drawing unwanted attention to these features in order to avoid looting or damage to the sites.

Mitigation of Black Point Homestead 2 and Black Point Homestead 3, which cannot be easily avoided by the development, is recommended prior to commencement of the quarry infrastructure construction. The testing phase should therefore consist of a formal testing regiment on both of the two sites to be impacted. Prior to excavation, the sites should be cleared of brush, branches, moss and other vegetation, etc. by the archaeological team to allow for detailed surface documentation. Two intersecting lines of formal 0.50 m by 0.50 m excavation units at 1 meter intervals are recommended through the center of both foundations. This is intended to establish a sense of the buildings' interior and exterior remains (both structural and artifactual), layout, stratigraphy and site formation, as well as site integrity. Formal testing is also recommended for the associated outbuilding in order to determine function and site layout. This program of testing will aid in establishing an assessment of site significance which will, in turn, allow the archaeologist to determine the best course for further

mitigation, if necessary. At this time it is anticipated that some additional excavation following testing may be necessary at Black Point 3, which is unique in layout at Fogherty Head.

In the event that any archaeological material is encountered during ground disturbance activities and an archaeologist is not already present on the site, all activity should cease and the Coordinator of Special Places, Sean Weseloh-McKeane (902-424-6475) should be contacted immediately to determine a suitable method of mitigation.

ARCHAEOLOGICAL & HERITAGE RESOURCES MANAGEMENT PLAN

Black Point Quarry

ARCHAEOLOGICAL & HERITAGE RESOURCES MANAGEMENT PLAN

Black Point Quarry

Prepared by

15 October 2014

Submitted to:
SLR Consulting (Canada) Ltd.

ARCHAEOLOGICAL & HERITAGE RESOURCES MANAGEMENT PLAN

Black Point Quarry

INTRODUCTION

This component plan is designed to identify, manage, mitigate and protect historic and First Nations archaeological resources potentially encountered in advance of and during construction of the Black Point Quarry in Guysborough County, Nova Scotia. This plan focuses on the requirements for construction monitoring and procedures to protect archaeological sites in construction areas.

In 2014, Davis MacIntyre & Associates Limited, under contract to SLR Consulting (Canada) Ltd., completed an archaeological assessment under Heritage Research Permit A2014NS099. This study concluded that there were a number of historic period archaeological resources including six house foundations and related outbuildings and stone field clearings, and four possible buildings related to the local fishery in the study area. Oral history also indicates that previous generations of the Fogarty family may have buried their deceased on a wooded headland above the water, though no physical evidence of this activity could be discerned during the field reconnaissance. The following plan includes general recommendations for the management and protection of archaeological resources, as per the standards of the Special Places Protection Act (*R.S., c.438, s.1*), as well as site-specific recommendations for known and suspected archaeological resources within the study area.

POTENTIAL CONSTRUCTION IMPACTS

Potential construction impacts arise from removal of large quantities of fill and native soil, potentially unearthing, damaging, or destroying archaeological resources. In this case, a number of historic period archaeological resources related to early settlement may be impacted by construction. The potential for First Nations archaeological resources has been determined to be low, though contingency measures should be in place to deal with the unlikely discovery of such resources.

Contingency measures will be in place to deal with any unexpected impacts to heritage resources which may be encountered during construction activities and which currently cannot be anticipated. Specific management initiatives are also recommended to deal with those known archaeological and heritage resources encountered during the 2014 reconnaissance.

REGULATORY REQUIREMENTS

The Special Places Protection Act provides the Nova Scotia Department of Communities, Culture and Heritage (CCH) with a mandate to protect important archaeological, historical and palaeontological sites and remains, both on land and underwater. The CCH administers and enforces the Act by overseeing the protection of all sites and remains in the Province, managing the Heritage Research Permit system, and designating outstanding heritage sites as "Protected Sites."

The *Archaeological & Heritage Resources Management Plan* includes details of site-specific management procedures for known archaeological resources as well as monitoring procedures and locations, mitigation measures, and protocols to be implemented in the event of the discovery of an archaeological site or artifact. The Plan should be implemented with input from the appropriate development personnel and regulatory bodies and the Culture and Heritage Development Division of the Nova Scotia Department of Communities, Culture and Heritage.

ENVIRONMENTAL MANAGEMENT

Pre-Construction Education and Awareness Training

Prior to construction, contractors should receive training from the Project Archaeologist in how to identify and protect archaeological resources that may be discovered. The pre-construction training will include some limited site recognition training for the types of archaeological sites that may occur in the construction areas. In general, indicators of a pre-contact archaeological site that may be encountered in construction areas include:

- Artifacts, such as flaked stone knives and projectiles, ground stone woodworking tools, hammer stones, and loose pieces of flaked stone, along with a variety of bone and antler tools and earthenware ceramics;
- Middens, which are the remains of ancient living areas identified by:
 - Shells and shell fragments;
 - Fish, bird and mammal bones;
 - Fire-altered rock;
 - Ash and charcoal; and,
 - Artifacts and cultural features (hearths or pits);
- Burial places, which are indicated by the presence of light brown to dark brown bones either whole or in fragments and may include certain types of artifacts or soil indicators and red ochre, calcined bone/cremains, *et cetera*.

However, it is unlikely that First Nations archaeological artifacts or features will be encountered in this context. It is more likely that historic period resources will be encountered which may include:

- Artifacts, tools, bottles
- Historical refuse such as:
 - Bottle and windowpane glass;
 - Tin cans;
 - Broken ceramics and crockery;
 - Broken toys;
 - Farming and fishing implements;
 - Electrical, plumbing, and heating fixtures;
 - Ash, charcoal;
 - Broken bricks and mortar; and
 - Wood

Dark soil that appears to be greasy in texture or contains ash, bone, charcoal, coal, shell fragments, and cultural materials like those listed above may indicate the potential of an archaeological site. Other visible signs can include linear or circular stone structures which may be indicative of foundations, wells, privies (outhouses), or outbuildings.

Archaeological Monitoring

The Project Archaeologist, or qualified representative, should monitor excavation works to ensure the protection of potential buried archaeological resources during construction. Monitoring should be conducted in those areas where intact archaeological resources are known or suspected to exist. This includes, but is not limited to, grading, tree removal (grubbing), and excavation.

Managing Archaeological Discoveries

During construction, archaeological sites may be managed in a variety of ways, including avoidance, salvage or emergency excavation and the use of temporary or long-term site protection measures.

If contractors make an archaeological discovery at a construction site they must stop work and contact the Project Archaeologist. The Project Archaeologist will determine an appropriate exclusion zone which will be no less than 30 m in diameter around the find and:

- Mark the 30 m exclusion zone around the discovery with snow fence or flagging, and install a sturdy barrier fence;
- Implement necessary slope stabilization, drainage, erosion and sediment control measures to protect the discovery.

The preferred long-term approach to managing archaeological discoveries in the construction area is avoidance. If avoidance is not feasible, then salvage or emergency excavations may be necessary. These operations will require a Heritage Research Permit (HRP), which are issued by CCH under the *Special Places Protection Act*. It is the

responsibility of the Project Archaeologist to ensure that suitable methodologies to cover the full range of circumstances in the case of emergency measures is in place and covered by the permit. These methodologies will be established in consultation with CCH. In the case of unexpected discoveries and emergency work, CCH and the client will be notified as to the location and scope of emergency measures. Any salvage or emergency excavations will be conducted by the Project Archaeologist. All onsite archaeological management strategies will be designed and supervised by the Project Archaeologist. Contractors must ensure that construction personnel and sub-contractors do not collect archaeological remains. However, if an isolated artifact is found and may be destroyed by not immediately removing it from the working area, then personnel should follow these steps:

- Collect the artifact and mark its location with flagging, a wooden stake or some other visible marker or, where possible, notify the Project Archaeologist immediately;
- Inform the Site Supervisor that an artifact was found; and,
- Establish a 30 m exclusion zone around the find.

The Project Archaeologist must then conduct a site inspection and develop the necessary mitigation plan. In the unlikely event that the finds are determined to, or may be, of First Nation origin, this plan must be coordinated with CCH and will be developed in consultation with the Archaeology Research Division (ARD) of the KMKNO. Again, avoidance is the recommended method of mitigation for any archaeological resources. If avoidance is not possible, it is recommended that the feature be recorded in detail by a qualified archaeologist prior to any disturbance. It is also recommended that any materials which assist in assigning a date, and further determining the significance of the resource, be collected for curation. In the case of small midden deposits a sampling strategy for collection of artifacts will be adopted with the purpose of determining a mean date for the deposit. If a significant intact archaeological feature is encountered (i.e. a foundation, well, privy, or other outbuilding), a strategy of mitigation will be adopted. Mitigation will focus on detailed recording and excavation and all cultural material will be collected with the aim of providing an intact record of the archaeological feature/site, recognizing that the feature/site is a non-renewable resource. Depending on the nature of the material that is brought up, archaeological conservation by a certified conservator may be required. In the interim, the material is to be stabilized and secured by the Project Archaeologist in consultation with certified conservators.

Site-Specific Measures for the Management of Known Archaeological Resources

Former Lukeman and Fogarty properties:

It is recommended that the three foundations at the east end of the property (the two on the former Lukeman property, and the third just beyond the western boundary on the former Crown parcel), as well as the foundation and four outbuildings on the former Fogarty property are currently expected to be avoided by construction activities. It is recommended that these features be well flagged by the Project Archaeologist and a 100 meter buffer be established around the features to ensure that their locations and

boundaries are well-known and they are not disturbed during construction. It is also believed that the headland on the northwest end of the former Fogarty property which may be the location of reported historic burials will be avoided by construction. It is recommended that this area also be flagged and that the buffer zones for these resources be surveyed for future reference. It is recommended that the flagging be removed after construction so as to avoid drawing unwanted attention to these features in order to avoid looting or damage to the sites.

Former Daly Homesteads:

The two foundations believed to be related to occupation by the Daly family are expected to be impacted by construction and, therefore, further assessment of these features is recommended. The southern of the two foundations is similar in character to the foundations on the former Lukeman and Fogarty properties which are expected to be avoided. Therefore, it is expected that other representative archaeological features will remain. The northern foundation, however, is unique. It is recommended that both sites be subjected to formal testing which will require clearing the sites of brush, branches, moss and other vegetation in order to complete a detailed survey and documentation of the features. Two intersecting lines of formal 0.50 m by 0.50 m excavation units at 1 meter intervals are recommended through the center of both foundations. This is intended to establish a sense of the buildings interior and exterior remains (both structural and artifactual), layout, stratigraphy and site formation, as well as site integrity. Formal testing is also recommended for the associated outbuilding in order to determine function and site layout. This program of testing will aid in establishing an assessment of site significance which will, in turn, allow the archaeologist to determine the best course for further mitigation, if necessary.

It is necessary that a more convenient and expedient access route to these sites be established before further mitigation can be conducted. This may require that, preferably, the access road at the east end of the property be built or that transportation be supplied via boat and ATV before archaeologists can transport excavation equipment to the sites on the former Daly property. The latter option will require a substantial amount of travel time in and out of the sites each day.

Discovery of Human Remains

In the unlikely event that human remains or suspected human remains are discovered in working areas the contractor must:

- Immediately stop construction and notify the Project Archaeologist and Site Supervisor;
- Cover exposed bone with plastic sheeting, blanket or some other clean cover;
- Do not cover any finds with fill;
- Ensure that site security is immediately established to carry through until the nature of remains and/or location are determined.

The Project Archaeologist will then notify the appropriate people (these may include the local detachment of RCMP and the Office of the Medical Examiner, CCH, and representatives of KMKNO). If the remains are confirmed to be of an archaeological nature then negotiations will follow to determine how the remains will be handled.

Note that if remains are discovered during construction excavations, in the box of a truck or in an excavation bucket for example, then the excavated material must be carefully placed on the ground, in a secure area for inspection by the Project Archaeologist. If the detected material is determined or suspected to be human remains, the entire contents of the bucket must be sifted through 1/4 inch mesh, as per standard archaeological practice. Further excavation at the site of discovery must cease immediately until the Project Archaeologist can determine if additional remains exist at the site.

Discovery of Human Remains that are of Modern Origin

If the remains are human, and are determined to be of recent origin, the RCMP and Office of the Medical Examiner will assume responsibility for the remains.

Guidelines for the Archaeological Handling and Treatment of Human Remains

Onsite management strategies for the discovery of human remains will require consultation with CCH and other representatives (Mi'kmaq, Afro-Canadian community, etc), as appropriate. One of the following two strategies may be followed:

- The remains are to be left undisturbed in their original location where possible. If additional remains are suspected to be present, a program of delineation is required through archaeological techniques if the project is expected to further impact on the area. Once delineated, an impact-exclusion zone can be established and partial project redesign may be necessary.
- If the remains must be removed or have been disturbed, salvage or emergency excavation to remove the remains for reburial by the local community or First Nations (depending upon the origin of the remains) may be required.

The following is a list of guidelines that must be adhered to by all archaeologists responsible for the management, handling, and treatment of human remains, whether they are of Euro-Canadian or First Nations origin:

- Any natural elements of the human body including bones (whether partial or complete), teeth (partial or complete), hair, and nails are to be treated as human remains;
- Rubber, latex, or cotton gloves must be worn when handling human remains, including at initial discovery in the soil or screen;
- Remains or suspected remains must be packaged in acid-free paper and placed in a secure container with full provenience noted.
- Once the remains or suspected remains have been removed from the site (if

necessary) they are to be carefully stored in a locked laboratory or office until plans for reburial or storage can be made.

It is important to note that human remains are not accepted for curation by the Nova Scotia Museum as they do not constitute archaeological or artifactual remains.

Human Remains Discovered that are not of Modern Origin and First Nation

In the case of First Nations human remains, bodies may have been cremated and consequently, skeletal material is typically more fragmented and modified by the burning process. These *cremains* may be more difficult to identify by the untrained eye. First Nations burials may also be identifiable by the presence of red ochre, a naturally-occurring mineral pigment that was often used in First Nations ritual burial practices. The following are a list of guidelines that must be adhered to by all archaeologists responsible for the management, handling, and treatment of human remains if they are suspected to be of First Nations origin:

- Representatives of KMKNO are to be contacted to arrange for a culturally-appropriate container as well as traditional medicines and herbs to be supplied for the storage of the remains. In the interim, the remains must be stored in the same manner as those not suspected to be of First Nations origin.
- Representatives of KMKNO are to be contacted immediately to perform the necessary ceremonial rites (i.e. smudging of the site, the remains, the container for the remains and the person responsible for care of the remains, and ensure a culturally appropriate delegate to care for the remains; as well as any other ceremonial rites First Nations representatives may deem appropriate).
- Immediate and continual consultation with KMKNO will be established regarding their treatment, handling, storage, and ultimate destination which may differ from the measures applied to non-First Nations individuals' remains.
- Any testing of the material, where the remains are determined or suspected to be of First Nations' individuals' origin must be planned with the support and approval of the appropriate First Nation representative, such as KMKNO on behalf of the Mi'kmaq of Nova Scotia.

BLACK POINT AGGREGATE QUARRY PROJECT

SUMMER 2014 NEWSLETTER

Welcome

We are pleased to share the first edition of the Black Point Aggregate Quarry Project newsletter. The newsletter will provide you with accurate and timely information about the project and key milestones. We plan to publish newsletters on a semi-annual basis, or when specific project developments warrant additional communications.

Have a great summer,
The Black Point Project Team

ENVIRONMENTAL ASSESSMENT BEGINS

The environmental assessment process for the Black Point Aggregate Quarry Project is underway. On February 28, 2014, the Project Description was formally submitted to the Canadian Environmental Assessment Agency (CEAA). Following this submission, a 30 day public comment period commenced, and on April 28, CEAA provided the Draft Guidelines for preparation of an Environment Impact Statement (EIS) report.

On June 9, CEAA and Nova Scotia Environment (NSE) issued the final EIS Guidelines, which are available for review on the CEAA website (<https://www.ceaa-acee.gc.ca> search: Black Point 80064). The guidelines describe the information and studies that will be needed to support the environmental assessment report.

In support of the EIS preparation, the project team has met with a number of specialists at NSE and the Department of Fisheries and Oceans (DFO) to understand their expectations with respect to wetlands, groundwater and the marine environment. Similar meetings are planned with fishermen, tourism operators and members of the Community Liaison Committee to gain further understanding of the public's expectations.

The project team has also been meeting with First Nation communities and organizations to learn more about First Nation interests in the project, as well as how First Nation engagement will take place during the environmental assessment process. This includes meeting with CEAA, NSE, and the Mi'kmaq Rights Initiative (KMK) on May 27, and with the Shubenacadie Band and CEAA on June 17.

On June 18, we toured the site with representatives from the CEAA, NSE, DFO, KMK, and the Confederacy of Mainland Mi'kmaq (CMM). The visitors viewed the site from the coast to the east and west of the property, and then walked to the highest elevation on the site, which provides views of Chedabucto Bay, Fogherty Lake and Lookout Hill.

We are currently advancing some of the baseline studies that will support the environmental assessment. At this early stage in the project, we're focused on collecting data and information about the site (both terrestrial and marine components), while at the same time we're identifying issues of community concern and responding to questions raised about the project.

For more information on the Black Point Aggregate Quarry and Marine Terminal and the environmental assessment please visit www.MorienRes.com/Black-Point.

PROJECT OVERVIEW

The proposed Black Point Aggregate Quarry Project consists of the development and operation of a construction aggregate quarry and marine terminal in Guysborough, Nova Scotia. The project is being developed by Morien Resources Corp., a Nova Scotia-based mineral exploration and development company, and Vulcan Materials Company, a leading producer of construction aggregates in the United States.

Project lifespan:	50+ years
Quarry size:	180 hectares of a 354 hectare property
Estimated volume:	400+ million tonnes of high quality aggregate
Employment:	120-150 direct and indirect jobs during peak production and 50-60 full time employees at operation
Capital expenditure:	\$80-\$110 million

ON-SITE ACTIVITY

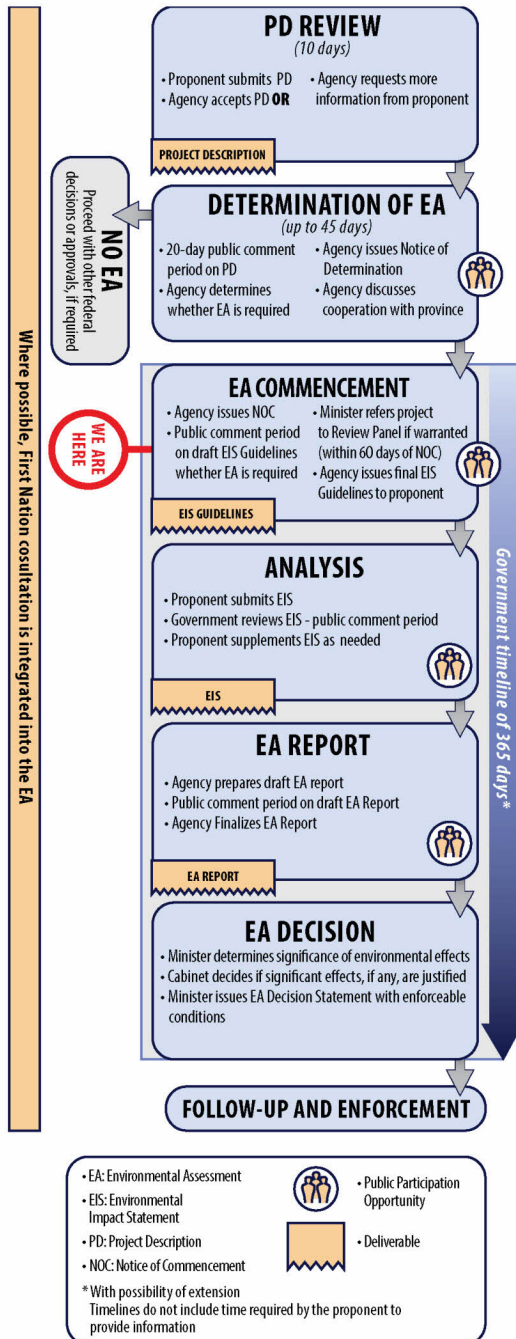

Representatives of Morien and Vulcan expect to be on the site more frequently throughout the summer to continue baseline environmental studies. There has been no clearing or construction activity on the site.

BLACK POINT AGGREGATE QUARRY PROJECT

SUMMER 2014 NEWSLETTER

ENVIRONMENTAL ASSESSMENT PROCESS

www.ceaa-acee.gc.ca

OPEN HOUSE

On April 22, Morien and Vulcan hosted the first of several open house meetings at the Queensport Fire Hall. Approximately 200 people attended the open house to learn more about the project proponents, Morien Resources Corp. and Vulcan Materials Company, the environmental assessment, and future opportunities for engagement. We are very appreciative of the strong support and interest in the project.

The display boards from the Open House can be viewed at www.MorienRes.com/Black-Point.

SUPERPORT DAYS

On July 10, Frank Lieth, Director of Geological Services with Vulcan, presented an overview of the Black Point Aggregate Quarry Project at the annual Strait of Canso Superport Days. The event attracted over 120 delegates with a focus on doing business along the Strait of Canso and prospering into the future.

COMMUNITY LIAISON COMMITTEE

A Community Liaison Committee (CLC) is being established for the project. The CLC will encourage two-way communication with the community, and facilitate input and engagement on project activities. The project team solicited potential candidates at the open house and also ran a series of advertisements in the Guysborough Journal, ending on May 15th. We have received great interest from community members and are currently contacting people who have expressed interest in participating. The list of CLC members will be made public following the first meeting in August.

CONTACT US

For more information on the proposed Black Point Aggregate Quarry Project visit www.MorienRes.com/Black-Point or contact Morien Resources Corp at 902-466-7255 or info@MorienRes.com.

BLACK POINT QUARRY PROJECT

WINTER 2014 - 2015 NEWSLETTER

Hello

We are excited to update you on the progress of the Black Point Quarry Project.

The Team is committed to transparent communication and providing all stakeholders with accurate information as the project progresses.

In this newsletter, you will read about the Environmental Impact Statement (EIS) submission to Canadian Environmental Assessment Agency (CEAA) and the next steps in the Environmental Assessment process. We also introduce you to the Community Liaison Committee (CLC), a diverse group of volunteers who have committed to meeting regularly, providing input and facilitating open communication between the local community and the Project Team. We continue to stay busy and active in the province and municipality. For a list of recent community outreach events, see page 3.

In October, you may have been one of the 350 residents polled about your awareness of the Black Point Quarry Project. According to the poll, commissioned by the MODG, residents overwhelmingly support the Black Point Quarry Project, citing job creation and economic growth as major benefits. The poll also indicated that more information about the project is desired by the public. In response, we have mailed a four page "Frequently Asked Questions" document to each home in the Municipality of the District of Guysborough (MoDG). We trust that the additional information will be helpful, but as always, please check out our website at www.blackpointquarry.ca.

And lastly, we ask you to join us this Winter as we host our second open house meeting on March 11, 2015 at the Queensport Fire Hall. We will have visual boards on display, along with subject matter experts to answer your questions.

We look forward to seeing you soon,

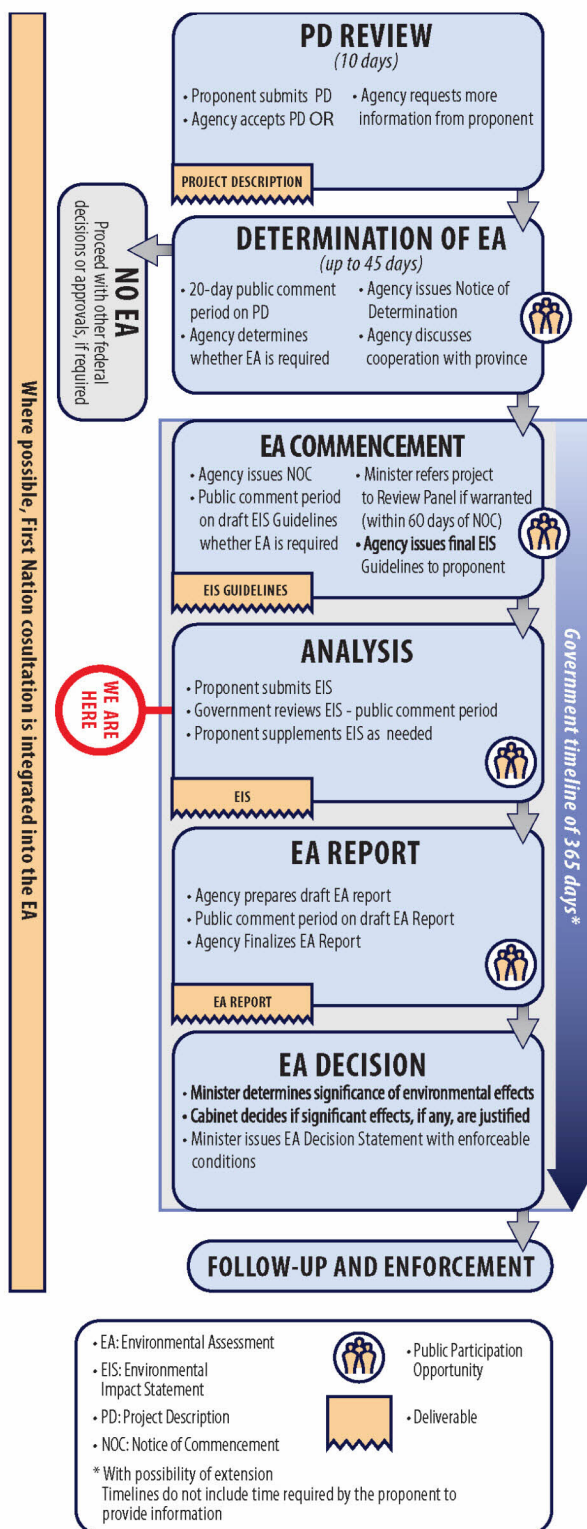

The Black Point Project Team

BLACK POINT QUARRY PROJECT RECEIVES MAJOR ENDORSEMENT FROM FISHERMEN

The Black Point Quarry Project started the New Year with a major endorsement from the Guysborough County Inshore Fishermen's Association of the Black Point Quarry Project.

"We are grateful to receive the support from the members of the Guysborough County Inshore Fishermen's Association," said Frank Lieth, Director of Geological Services, Vulcan Materials Company. "We believe this endorsement by the Association for the Black Point Quarry Project reflects the overall desire of the community and validates the ongoing dialogue we have had and continue to have with the fishing industry here in Guysborough County."

Continued on page 2...

www.ceaa-acee.gc.ca

BLACK POINT QUARRY PROJECT

WINTER 2014 - 2015 NEWSLETTER

"We are very appreciative of the support we have been receiving from all parts of the community," added Lieth. "We intend to keep working hard to ensure that we earn the trust of residents in Guysborough by delivering on our commitments and continuing our open and transparent relationship with people throughout the community."

ENVIRONMENTAL ASSESSMENT

On October 31, 2014 we successfully submitted a draft of the Project Environmental Impact Statement (EIS) to the Canadian Environmental Assessment Agency (CEAA, <http://www.ceaa-acee.gc.ca/>). The 2,100 page document provides a detailed project description of the Black Point Quarry and addresses any environmental effects of the proposed project, as well as actions to mitigate any adverse impacts. Analysis in the EIS include air and noise studies, surface water and groundwater quality, mainland moose and other threatened or endangered species, archeological studies, in addition to social and economic assessments. We have received the first comments back from CEAA and are in the process of preparing the final version. Despite its length, there will be a summary document once the final version of the EIS is submitted in the next two months. This will be available online and at select public viewing locations in MoDG.

COMMUNITY LIASON COMMITTEE

The Black Point Quarry Project Community Liaison Committee (CLC) was established in August 2014. Meetings have taken place on August 12, 2014 and October 15, 2014. The next CLC meeting has been tentatively scheduled for February 2015.

CLC Members continue to be available to take suggestions, answer questions or convey concerns about the Project to the Project Team.

BLACK POINT QUARRY PROJECT

WINTER 2014 - 2015 NEWSLETTER

MODG POLLS THE COMMUNITY

During October 24-31, 2014, the Municipality of the District of Guysborough commissioned a study to poll the community's awareness of the Black Point Quarry. 350 residents were randomly selected and asked about their awareness and knowledge levels, and their support or opposition of the Project.

The results? Participants overwhelmingly support the Project. Seventy six percent of the respondents registered their support of the Project, with half of those declaring that they "strongly support" the Project. Eighteen percent stated that they neither support nor oppose it, while only 6% of interviewees said they "oppose" the Project. It is noteworthy that of those neutral respondents, over half lean in support of the Project.

While awareness of the Project is high at 84%, our work continues. Poll respondents, although favorable to the Project, consider themselves to have low levels of knowledge about the Project. The Black Point Quarry Project Team is committed to transparency and information sharing. We will continue to update and engage with all stakeholders. Whether it is through periodic newsletters, website updates, open houses and other community outreach, we are committed to enhancing the community's awareness and knowledge of the Black Point Quarry Project. We encourage you visit our Black Point Quarry project webpage at www.blackpointquarry.ca for updates and additional information.

COMMUNITY OUTREACH

- October 15, 2014: Community Liaison Committee Meeting at the Queensport Fire Hall
- October 16, 2014: Visited the 4th grade class at Fanning Academy, teaching a session on rocks and minerals
- October 16, 2014: Presented an overview of the Black Point Quarry Project to the high students at Fanning Academy, and discussed future job opportunities
- October 27, 2014: the Black Point Quarry Project Team provided a tour of the proposed quarry site to Chief Wilbert Marshall (Potlotek First Nation) and Kerry Prosper (Paq'tnkek First Nation)
- October 28, 2014: Presented an overview of the Black Point Quarry Project to the high school students at Guysborough Academy, and discussed future job opportunities
- October 28, 2014: Visited middle school students at Guysborough Academy, teaching a session on rocks and minerals
- November 13, 2014: Team member Chris Ridgway (Vulcan) was a featured speaker at the Department of Natural Resources' annual Geology Matters conference in Halifax, providing an introduction to Vulcan Materials Company and the Company's social responsibility programs, as well as an update on the Project
- December 2, 2014: Project Manager, Frank Lieth (Vulcan), provided an overview and update on the Project to the Strait Area Chamber of Commerce

BLACK POINT QUARRY PROJECT

WINTER 2014 - 2015 NEWSLETTER

OPEN HOUSE

Black Point Quarry Project Open House

DATE	March 11, 2015
TIME	3:00 – 7:00 pm
	A brief presentation will be given at 3:30 pm and 6:00pm
LOCATION	Queensport Fire Hall 5615 HWY 16 Queensport, NS

The Black Point Project Team invites you to attend an open house meeting on March 11, 2015 at the Queensport Fire Hall.

As a follow up to our April 2014 Open House, we will be providing visitors with an update on the Project. Subject matter experts will also be on hand to answer your questions.

For more information about the meeting, visit: www.blackpointquarry.ca, or call (205) 298-3189.

Attachment 2 – CLC Terms of Reference

Black Point Quarry Project
Guysborough County, NS
SLR Project No.: 210.05913.00000

Black Point Quarry

Community Liaison Committee (CLC)

TERMS OF REFERENCE

PURPOSE

To bring together community members of the Municipality of the District of Guysborough to provide input and facilitate open communication between the local community and the Black Point Quarry Project Team; to protect and enhance the quality of life for all residents, and to promote a vibrant and sustainable economic climate in the Municipality of the District of Guysborough.

OBJECTIVES

- To serve as an advisory body providing the Black Point Quarry Project Team (Project Team) input on existing or potential community concerns as it relates to the Black Point Quarry Project (the Project);
- To represent community interest;
- To communicate information and updates to the community as it relates to the Project in a timely manner thereby reflecting a true transparency as the project proceeds from permitting to construction to operations;

MEMBERS

Participation in the Community Liaison Committee (CLC) is open to individuals interested in providing guidance and input on the Project. The CLC will be made up of at least 6 and no more than 12 individuals who collectively provide a balanced and broad representation of members in terms of interest in the Project, location relative to the Project and insight on the Project. The CLC will include Project Team members and the Warden will serve ex-officio.

Individuals in attendance at the April 22, 2014 Black Point Quarry Project Open House were invited to sign-up to participate in the CLC. Members of the CLC were also solicited in local advertisement in the *Guysborough Journal* and via the Project website www.morienres.com/black-point.

The recruitment of members may also be sought from the First Nations community, African Nova Scotian community, local fisheries representative, local Municipality of the District of Guysborough Councillor, staff member of the Municipality of the District of Guysborough, and local economic development organizations.

If numerous nominations are received for representation from the same geographic area or interest, the Project Team may elect to randomly draw potential members for each area or interest.

All members of the CLC will be selected by the Project Team, with guidance from Municipality of the District of Guysborough staff.

CLC participation is on a voluntary basis.

Participation in the CLC does not constitute support or endorsement of the Black Point Quarry Project, but rather CLC members share a desire to provide community input and guidance to the Project Team and represent the community interests.

All appropriate and reasonable expenses to conduct meetings are reimbursed through an account managed by the Project Team.

OVERVIEW: MEMBER ROLES AND RESPONSIBILITIES

Positions to be held:

CO-CHAIRS	<p>A representative of the Project Team will act as Chair during the first meeting, at which time the committee will select a Co-Chair from among the members present.</p> <p>The Co-Chairs are responsible for:</p> <p>Managing CLC meetings, including setting meeting agendas, timing of agenda items and adherence to purpose and objectives of the committee, ensuring focused discussions;</p>
Secretary	<p>A member of the Project Team will serve as Secretary, providing support in drafting and distribution of minutes, notices of meetings, agenda preparation, meeting coordination, and logistics and support to the committee and the Co-Chairs.</p>
CLC Members	<p>CLC members are representatives of their community, group or organization. As such, each member is responsible for the sharing of perspectives and information from their community, group or organization with other members of the CLC and the Project Team. Members are also responsible for sharing factual information obtained from the CLC with their community, group or organization.</p>

PRINCIPLES OF PARTICIPATION

Each member of the CLC will abide by the following principles of participation:

- the CLC is not a decision-making body. There will be no voting. The CLC is in place to provide input, knowledge and advice to the Protect Team;
- open dialogue in an atmosphere of mutual respect and professional conduct;
- supportive role to seek solutions to misunderstandings with or within the community, if they arise;
- respect the consensus approach of the panel and reflect this in dialogue with other parties;
- represent as broad a base of the community as possible;
- respect the confidentiality of key business information that may, from time-to-time, be shared with the committee.

ROLE AND RESPONSIBILITIES OF MEMBERS

- work collaboratively with the Project Team by providing practical advice and feedback to help avoid or minimize impacts from the Project on the community and environment;
- be prepared to consider a range of views, and work in a respectful way while positively addressing issues and concerns;
- provide input and guidance on community opinions, issues and concerns with respect to the Project;
- provide suggestions on communications efforts necessary to enhance community participation and inform the community and other organizations;
- allow name, email and telephone number to be published as a CLC member;
- be prepared to attend CLC meetings, including review of appropriate documents and information.

Location

CLC meetings will be held at a suitable location in the Municipality of the District of Guysborough as determined by the Project Team.

QUORUM

The CLC is considered to have a quorum when at least 50% of all members are present, and at least one representative from the Project Team.

AGENDA

The agenda for each meeting will be set by the CLC. Any CLC member can request that a matter be placed on the agenda for the next meeting by communicating information to the Secretary no later than five business days prior to the meeting at which the matter is to be discussed.

MINUTES

The minutes of each meeting of the CLC will be prepared by the Secretary or designee and will be distributed to CLC members within 15 days of that meeting.

Vulcan

Materials Company

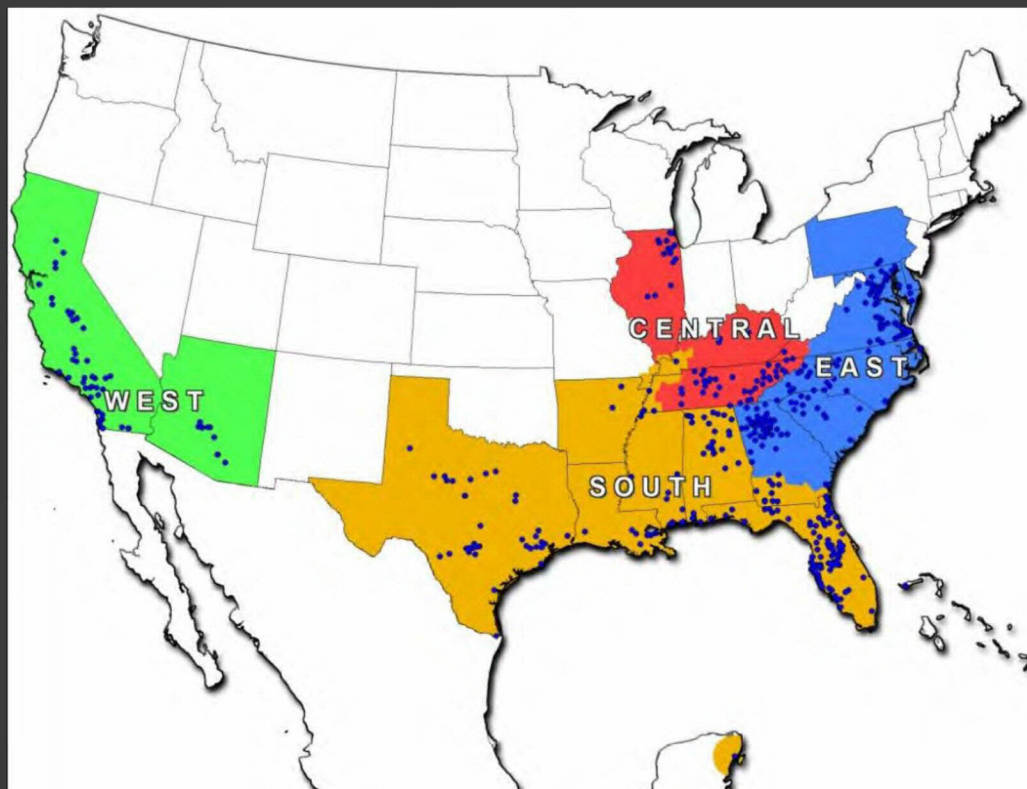

BUILDING STRONGER COMMUNITIES

We have built a successful company over many decades because we believe that doing the right thing – socially, environmentally and financially – is the right way to do business.

VULCAN'S REGIONS

Regional Headquarters and States Served

- The nation's largest producer of construction aggregates, primarily crushed stone, sand and gravel

- Public company with shares traded on the NYSE

- Market Cap: \$7.7 billion Revenues: \$2.8 billion

**December 31, 2013*

CAPITAL EXPENDITURES		
	2013	2012
Plant property & equipment expense	\$275 M	\$95 M
Business Acquisitions	\$90 M	\$0

- Operating 342 aggregates facilities, serving markets in 18 states, the District of Columbia, Mexico and the Bahamas with a full line of aggregates and employing 6,902 people

- A major producer of asphalt and concrete

- Headquartered in Birmingham, Alabama

END USES

- Highways, roads, streets and other public works projects
- Housing, non-commercial buildings, commercial and industrial buildings, railroad ballast and in non-construction uses such as agriculture

CALICA OPERATION

Vulcan's largest quarry operation is an international venture that produces a full line of crushed limestone products on Mexico's Yucatan Peninsula.

Vulcan owns three Panamax-class, self-unloading ships that transport products to sales and distribution yards along the U.S. Gulf Coasts and Atlantic.

SAFETY IS OUR #1 PRIORITY

**PROTECTING THE HEALTH, SAFETY AND WELL-BEING
OF OUR WORKFORCE IS PARAMOUNT.**

SAFETY & HEALTH AWARDS & RECOGNITIONS

Protecting the safety and health of our employees are essential priorities for Vulcan. We are proud to have our employees and facilities recognized for their operational excellence, exemplary efforts in safety and health.

- 2013 Excellence in Hearing Loss Prevention Award (Manufacturing Sector) National Institute of Occupational Safety and Health (NIOSH) in partnership with National Hearing Conservation Association (NHCA)
- 2013 National Ready Mixed Concrete Association Excellence in Safety – Gold, Silver and Bronze Levels
- 2012 Eagle Award of Excellence – Safety Award Georgia Construction Aggregates Association
- 2012 National Ready Mixed Concrete Association Excellence in Safety – Gold, Silver and Bronze Levels
- 2012 Safety Awards, Virginia Transportation Construction Alliance (VTCA) and Virginia Department of Mines, Minerals and Energy-Division of Mineral Mining (DMM)
- 2012 California Construction and Industrial Materials Association – Safety Award
- 2011 Sentinels of Safety – Mine Safety and Health Administration (MSHA)
- 2011 NSSGA Sterling Safety Award – Bronze
- 2011 NSSGA Safety Excellence – Gold, Silver and Bronze Levels
- 2011 Safety Awards, Virginia Transportation Construction Alliance (VTCA) and Virginia Department of Mines, Minerals and Energy-Division of Mineral Mining (DMM)
- 2010 NSSGA Safety Excellence – Gold, Silver and Bronze Levels
- 2010 NSSGA James M. Christie Safety & Health Professional Award
- 2010 NSSGA Berry Wendt Award (Safety & Health)
- 2010 Outstanding Contribution to Mine Safety and Health, International Society of Mine Safety Professionals
- 2010 Sentinels of Safety – Mine Safety and Health Administration (MSHA)
- 2010 National Ready Mixed Concrete Association Excellence in Safety Award – Gold, Silver and Bronze Levels
- 2009 NSSGA Safety Excellence – First, Second and Third Place Awards

LAND RECLAMATION

WE ARE COMMITTED TO RESPONSIBLE STEWARDSHIP OF THE LAND.

- A former quarry operation, the Rank Island project preserved ponds, wetlands and riparian along the San Joaquin River in Fresno County, California
- 2011 Award for Excellence in Reclamation from State of California's Department of Conservation, Office of Mine Reclamation
- 300-acre project site attracts and provides food, water, habitat and open space for over 175 species of wildlife including over 136 species of birds

WILDLIFE HABITAT ENHANCEMENT

Developing wildlife habitat buffer lands around our facilities has been an important environmental program for Vulcan. We now have 43 certified wildlife habitats at sites across North America, making us the second largest company in the United States with certified habitats and third globally.

ENVIRONMENTAL STEWARDSHIP AWARDS & RECOGNITIONS

We are proud of our awards for environmental programs.

- 2013 Energy Showcase Award San Diego Gas & Electric (California)
- 2012 NSSGA Environmental Excellence Award - Gold, Silver and Bronze Levels
- 2012 NSSGA Gold Environmental Excellence Award
- 2012 NSSGA Silver Environmental Excellence Award
- 2012 NSSGA Bronze Environmental Excellence Award
- 2012 VTCA-DMM Reclamation Award – Virginia Transportation Construction Alliance
- 2011 NSSGA Environmental Excellence Award - Gold, Silver and Bronze Levels
- 2011 Award for Excellence in Reclamation – California Department of Conservation,
Office of Mine Reclamation (OMR)
- 2010 NSSGA Environmental Excellence Award - Gold, Silver and Bronze Levels
- 2010 Corporate Sustainability Award – Industrial Environmental Association
- 2010 Solid Waste Reduction Award, Irwindale, CA Chamber of Commerce
- 2010 National Ready-Mixed Concrete Association Green-Star Certification
- 2009 NSSGA Gold Environmental Excellence Award

SOCIAL RESPONSIBILITY

We take pride in being a trusted corporate neighbor by engaging in open dialogue about our operations and by being responsible partners in the growing communities we serve.

COMMUNITY OUTREACH

- Our community involvement includes support for community and civic organizations.
- We provide financial support and take an active part in many public and charitable projects.
- We encourage and provide support to our employees who participate in local public service activities.

COMMUNITY RELATIONS PROGRAMS

In collaboration with the Mexican National Institute of Archaeology and History, we preserved Mayan ruins discovered on our Calica (Mexico) property when we began operations in the 1980s.

Vulcan employees and their families participated in the annual California Coastal Clean-Up Day volunteering to collect trash along San Diego area beaches.

OPEN HOUSES

Fostering long-term relationships with our neighbors requires us to be active participants in the community. One way is through open houses at our facilities to welcome our neighbors in and let them learn more about us.

EDUCATION

- 286 adopt-a-school partnerships
- Excellence-based college scholarships nationwide
- Internships and mentoring programs
- Job Shadow
- Matching gifts program
- Vulcan's Foundation support
- School Tours

These partnerships provide schools with much-needed resources. They provide us with an opportunity to teach young people about the free enterprise system, the benefits our industry provides to society and to enhance our image in the community.

COMMUNITY RELATIONS AWARDS & RECOGNITIONS

We are proud of our awards for community relations programs and activities.

2013 NSSGA Grassroots Coordinator of the Year

2012 NSSGA Excellence in Community Relations Award – Silver and Bronze Levels

2012 VTCA Community Excellence – Virginia Transportation Construction Alliance

2011 NSSGA Excellence in Community Relations Award – Gold, Silver and Bronze Levels

2011 VTCA Community Excellence – Virginia Transportation Construction Alliance (VTCA)

2011 Community Involvement Finalist – National Asphalt Pavement Association

2011 Fairfax County, VA Business Partnership Award

2010 NSSGA Excellence in Community Relations Award – Gold, Silver and Bronze Levels

2010 National Stars of Excellence – 2 Stars Award

2010 Business of the Year Award – City of Irwindale, CA and Irwindale Chambers of Commerce

2010 Excellence in Manufacturing – Corona, CA Chamber of Commerce

AWARDS & RECOGNITIONS

Fortune's World's Most Admired Companies

**Top 10 in Social Responsibility
twice in last decade*

**Top 10 for Use of Corporate Assets
and Long-Term Investment*

SAR and SOCConcern Status Definitions

Black Point Quarry Project
Guysborough County, NS
SLR Project No.: 210.05913.00000

SPECIES AT RISK AND SPECIES OF CONSERVATION CONCERN STATUS DEFINITIONS

1. *Species at Risk Act (SARA)*

A “species at risk” is an extirpated, endangered or threatened species or a species of special concern (Section 2.(1) Species at Risk Act. 2002, c. 29).

- Extirpated – a wildlife species that no longer exists in the wild in Canada, but exists elsewhere in the wild.
- Endangered – a wildlife species that is facing imminent extirpation or extinction.
- Threatened – a wildlife species that is likely to become an endangered species if nothing is done to reverse the factors leading to its extirpation or extinction.
- Special Concern - a wildlife species that may become a threatened or an endangered species because of a combination of biological characteristics and identified threats.

2. *Nova Scotia Endangered Species Act (NSESA)*

A “species at risk” means a species that is determined to be extinct, extirpated, vulnerable, threatened or endangered and is listed pursuant to Section 12 (Endangered Species Act. 1998, c. 11, s. 1).

- Extinct – a species that no longer exists and is listed as an extinct species pursuant to Section 12.
- Extirpated – a species that no longer exists in the wild in the Province but exists in the wild outside the Province and is listed as an extirpated species pursuant to Section 12.
- Endangered – species that faces imminent extinction or extirpation and is listed as an endangered species pursuant to Section 12.
- Threatened – means a species that is likely to become endangered if the factors affecting its vulnerability are not reversed and is listed as a threatened species pursuant to Section 12.
- Vulnerable – a species of special concern due to characteristics that make it particularly sensitive to human activities or natural events and that is listed as a vulnerable species.

3. *Committee on the Status of Endangered Wildlife in Canada (COSEWIC)*

COSEWIC determines the national status of wild Canadian species, subspecies and separate populations suspected of being at risk. COSEWIC bases its decisions on the best up-to-date scientific information and Aboriginal Traditional Knowledge available. All native mammals, birds,

reptiles, amphibians, fish, molluscs, lepidopterans (butterflies and moths), vascular plants, mosses and lichens are included in its current mandate. COSEWIC categorizes listed species based on a qualitative classification system as follows:

- Extinct – Species that no longer exists.
- Endangered – Species is facing imminent extirpation or extinction.
- Extirpated – Species that no longer exists in the wild in Canada, but occurs elsewhere.
- Threatened – Species is likely to become endangered if limiting factors are not reversed.
- Special concern – Species has characteristics that make it particularly sensitive to human activities or natural events.
- Not at Risk – Species that has been evaluated and found to be not a risk.
- Data Deficient – Species for which there is insufficient information to designate a status.

Although there are seven categories of classifications, review of the COSEWIC database is limited to those species listed as endangered, extirpated, threatened, and of special concern.

5. Atlantic Canada Conservation Data Centre (ACCDC)

Conservation Data Centres (CDCs), as part of The NatureServe (formally The Nature Conservancy) international network, track biodiversity at two levels: species and ecological communities. Species and ecological communities are referred to as elements of biodiversity. Elements are ranked in each jurisdiction (province or state) and at global and national levels in order to help prioritize conservation efforts. NatureServe and all CDCs (called Heritage Programs in the US) use a standardized element ranking system that has evolved over 30 years with input from hundreds of scientists, managers and conservationists. The ranking system is very elaborate and comprehensive, thus, the following material describes the National rarity of taxon in Canada as well as the Subnational, (i.e. provincial-level) ranking used in this investigation.

The National ('N', for Canada-wide status) and Subnational ('S', for Provincial status) rarity of taxon uses the following:

- N1/S1 – Critically Imperiled: Critically imperiled in the nation or province because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the province.
- N2/S2 – Imperiled: Imperiled in the nation or province because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or province.
- N3/S3 – Vulnerable: Vulnerable in the nation or province due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation.
- N4/S4 – Apparently Secure: Uncommon but not rare; some cause for long-term concern due to declines or other factors.

- N5/S5 – Secure: Common, widespread, and abundant in the nation or province.
- N#N#/S#S# – Numeric range rank: A range between two consecutive ranks for a species/community. Denotes uncertainty about the exact rarity (e.g., S1S2).
- NNR/SNR – Unranked: Nation or province conservation status not yet assessed.
- NNA/SNA – Not Applicable: A conservation status rank is not applicable because the species is not a suitable target for conservation activities.
- NH/SH – Historical: Previously occurred but may have been overlooked during the past 20-70 years. Presence is suspected and will likely be rediscovered; depending on species/community.
- NU/SU – Unrankable: Possibly in peril, but status is uncertain - need more information.
- NX/SX – Extinct/Extirpated: believed to be extirpated from its former range.
- N?/S? – Unranked: not yet ranked.
- NA/SA – Accidental: Accidental or casual, infrequent and far outside usual range. Includes species (usually birds or butterflies) recorded once or twice or only at very great intervals, hundreds or even thousands of miles outside their usual range.
- NE/SE – Exotic: An exotic established in the province (e.g., Purple Loosestrife or Coltsfoot); may be native in nearby regions.
-

The above rankings may be combined with one or more of the following qualifiers:

- B Breeding (Migratory species)
- N Non-breeding (Migratory species)
- ? Inexact or uncertain (the "?" qualifies the character immediately preceding it in the S-rank)
- C Captive or cultivated

5. Wild Species - The General Status of Species in Canada (GSWSC)

Reports from the Wild Species series represent the most comprehensive look at the state of Canada's species and contain the general status assessments for a broad cross-section of species, from all provinces, territories and ocean regions. Originating from the collaboration of all provincial and territorial governments in Canada, and of the federal government, reports from the Wild Species series represent a huge accomplishment that summarizes the monitoring efforts of species in the country.

The Wild Species reports are released every five years. The most recent report, Wild Species 2010, represents the third report of the series, after the 2000 and 2005 versions. Each species assessed in the Wild Species reports received a general status rank in each province, territory, or ocean region in which they are known to be present, as well as an overall Canada General Status Rank (Canada rank).

- 0.2: Extinct – Species that are extirpated worldwide (i.e., they no longer exist anywhere).
- 0.1: Extirpated – Species that are no longer present in a given geographic area, but occur in other areas.
- 1: At Risk – Species for which a formal, detailed risk assessment (COSEWIC status assessment or provincial or territorial equivalent) has been completed and that have been determined to be at risk of extirpation or extinction (i.e. Endangered or Threatened). A COSEWIC designation of Endangered or Threatened automatically results in a Canada General Status Rank (Canada rank) of At Risk. Where a provincial or territorial formal risk assessment finds a species to be Endangered or Threatened in that particular region, then, under the general status program, the species automatically receives a provincial or territorial general status rank of At Risk.
- 2: May Be At Risk – Species that may be at risk of extirpation or extinction and are therefore candidates for a detailed risk assessment by COSEWIC, or provincial or territorial equivalents.
- 3: Sensitive – Species that are not believed to be at risk of immediate extirpation or extinction but may require special attention or protection to prevent them from becoming at risk.
- 4: Secure – Species that are not believed to belong in the categories Extinct, Extirpated, At Risk, May Be At Risk, Sensitive, Accidental or Exotic. This category includes some species that show a trend of decline in numbers in Canada but remain relatively widespread or abundant.
- 5: Undetermined – Species for which insufficient data, information, or knowledge is available with which to reliably evaluate their general status.
- 6: Not Assessed – Species that are known or believed to be present regularly in the geographic area in Canada to which the rank applies, but have not yet been assessed by the general status program.
- 7: Exotic – Species that have been moved beyond their natural range as a result of human activity. In this report, Exotic species have been purposefully excluded from all other categories.
- 8: Accidental – Species occurring infrequently and unpredictably, outside their usual range.

6. Nova Scotia Museum of Natural History (NSMNH)

The Nova Scotia Museum of Natural History is an active partner with the provincial government in evaluating, protecting, and aiding in recovery efforts of habitats and species at risk. The Museum relies heavily on the COSEWIC and General Status Ranks to identify species at risk but compile records of confirmed sightings or collections of such species.

The Museum has developed a resource book titled Natural History of Nova Scotia that is intended to provide a framework in which the significant natural resources of the province of Nova Scotia can be understood, managed and interpreted. The information is useful for parks and natural areas planning, management and interpretation; land use planning for municipalities; development project planning, assessment and evaluation; eco-tourism and recreational planning. Accordingly, the Museum has generated a broad base of knowledge pertaining to Nova Scotia environment, and therefore, is an exceptional source for information related to species at risk and potential for species to be present at any particular site.

DATA REPORT 3928: Black Point, NS

Prepared 30 April, 2010
by S.H. Gerriets

CONTENTS OF REPORT

1.0 Preface

- 1.1 Caveats
- 1.2 Additional Information

2.0 Study Area Results

- 2.1 Flora
- 2.2 Fauna
- Map 1: Flora and Fauna

3.0 Special Areas

- 3.1 Managed Areas
- 3.2 Significant Areas
- Map 2: Special Areas

4.0 Taxa List

5.0 Source Bibliography

1.0 PREFACE

The Atlantic Canada Conservation Data Centre (ACCDC) is part of a network of circa 85 NatureServe data centres & heritage programs in 10 provinces, 1 territory, 50 states, plus several Central and South American countries. The NatureServe network is more than 30 years old and shares a common conservation data methodology. The ACCDC was founded in 1997, and maintains data for the jurisdictions of New Brunswick, Nova Scotia, Prince Edward Island, Newfoundland and Labrador. Although a non-governmental agency, the ACCDC is supported by 6 federal agencies, plus 4 provincial governments, outside grants and data processing fees. URL: www.ACCDC.com.

Upon request, the ACCDC provides known occurrence data for rare and endangered flora and fauna, in and near a specified study area. As a standard supplement to that data, the ACCDC includes locations of managed areas with some level of protection for flora and fauna, and also known sites of ecological interest, e.g. NB DOE Environmentally Significant Areas. Floral, faunal and Special Areas data are attached to our e-mail response as *.dbf files which may be opened from within data software (e.g. Excel, Access) or mapped in GIS (e.g. ArcView, MapInfo, AutoCAD).

1.1 CAVEATS

While the ACCDC makes a strong effort to verify the accuracy of all the data it obtains, generates and manages, it shall not be held responsible for any inaccuracies in any data that it provides. The following CAVEATS apply:

- a.) Data is restricted to use by the specified Data User; any third party requiring data must make its own data request.
- b.) To ensure the currency of data, the ACCDC requires Data Users to cease using data 12 months after receipt; if data is still needed after that term, the ACCDC will supply current data as a replacement.
- c.) ACCDC data responses are restricted to that data in our Data System at the time of the data request.
- d.) Data is qualified as to location (Precision) and time (SurveyDate); cf Data Dictionary for details.
- e.) ACCDC data reports are not to be construed as exhaustive inventories of taxa in an area.
- f.) The non-occurrence of a taxon cannot be inferred by its absence in an ACCDC data report.

1.2 ADDITIONAL INFORMATION

Please direct biological questions about ACCDC data to: Sean Blaney, ACCDC: (506) 364-2658, and technical data queries to: Stefen Gerriets, ACCDC: (506) 364-2657.

For provincial information on rare taxa and protected areas, or information on game animals, deer yards, old growth forest, archeological sites, fish habitat etc, please contact Sherman Boates, NSDNR: (902) 679-6146.

For more specific information about Peregrine Falcon locations, please contact: Diane Amirault, CWS: (506) 364-5060.

2.0 RARE AND ENDANGERED TAXA

A 100km buffer around the study area contains a relatively large (quintile 5) density of taxa records: 1528 records of 301 taxa from 55 sources. (Data Density: 19.46 rec/km²).

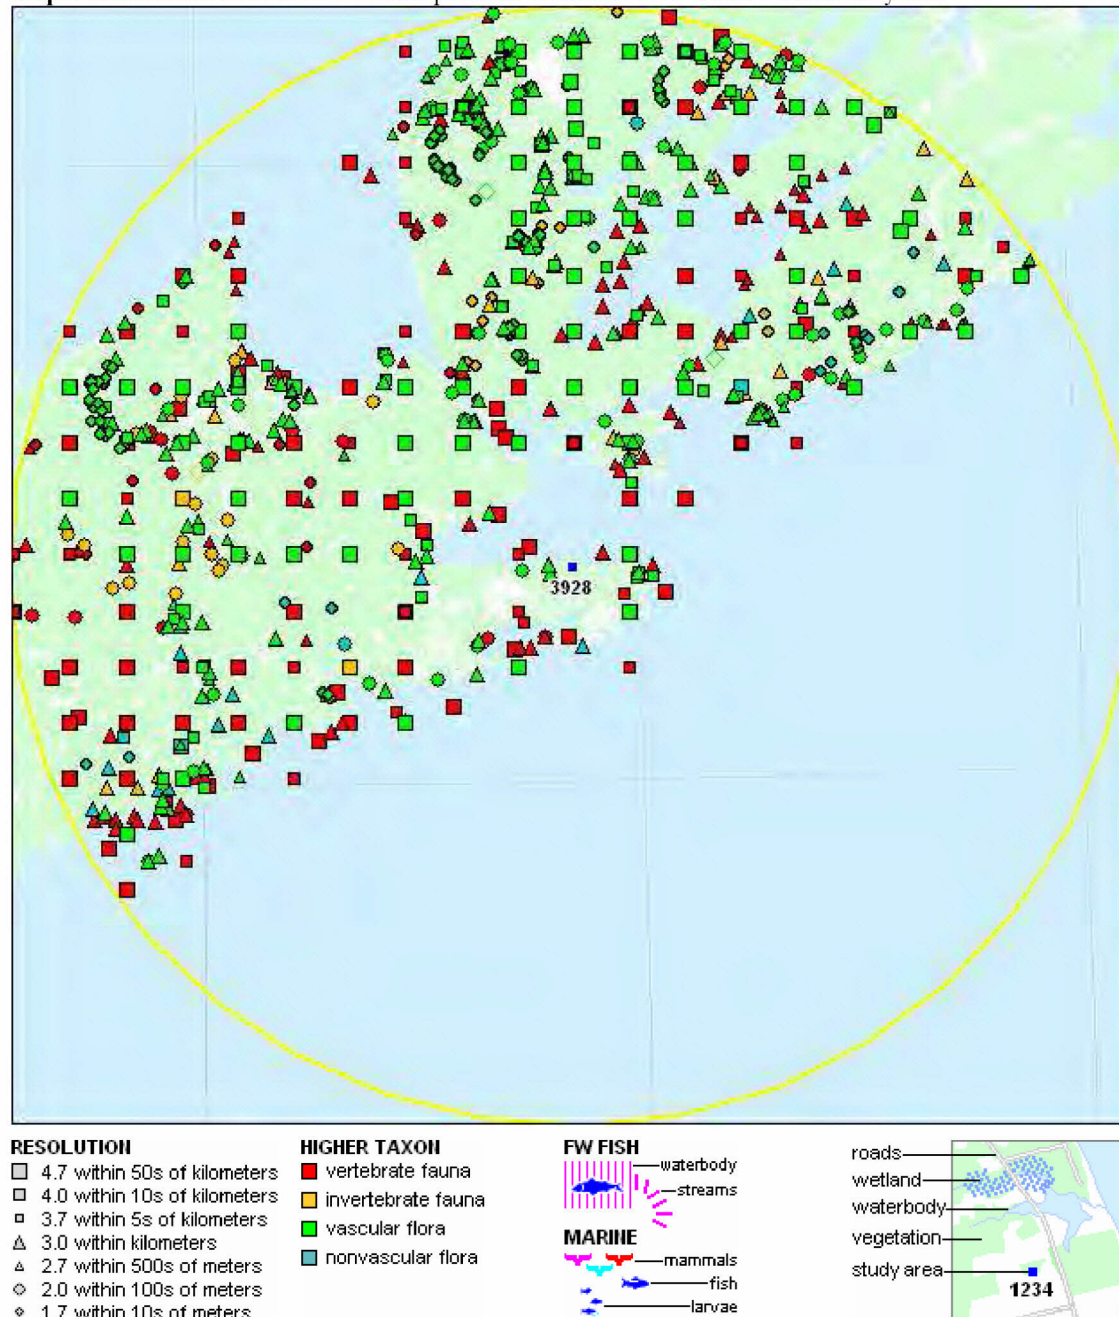

2.1 FLORA

A 100km buffer around the study area contains 715 records of 205 vascular, 38 records of 7 nonvascular flora (see attached *ob.dbf).

2.2 FAUNA

A 100km buffer around the study area contains 660 records of 56 vertebrate, 115 records of 33 invertebrate fauna (cf attached *ob.dbf). No data-sensitive taxa were identified.

Map 1: Known observations of rare and/or protected flora and fauna within buffered study area.

3.0 SPECIAL AREAS

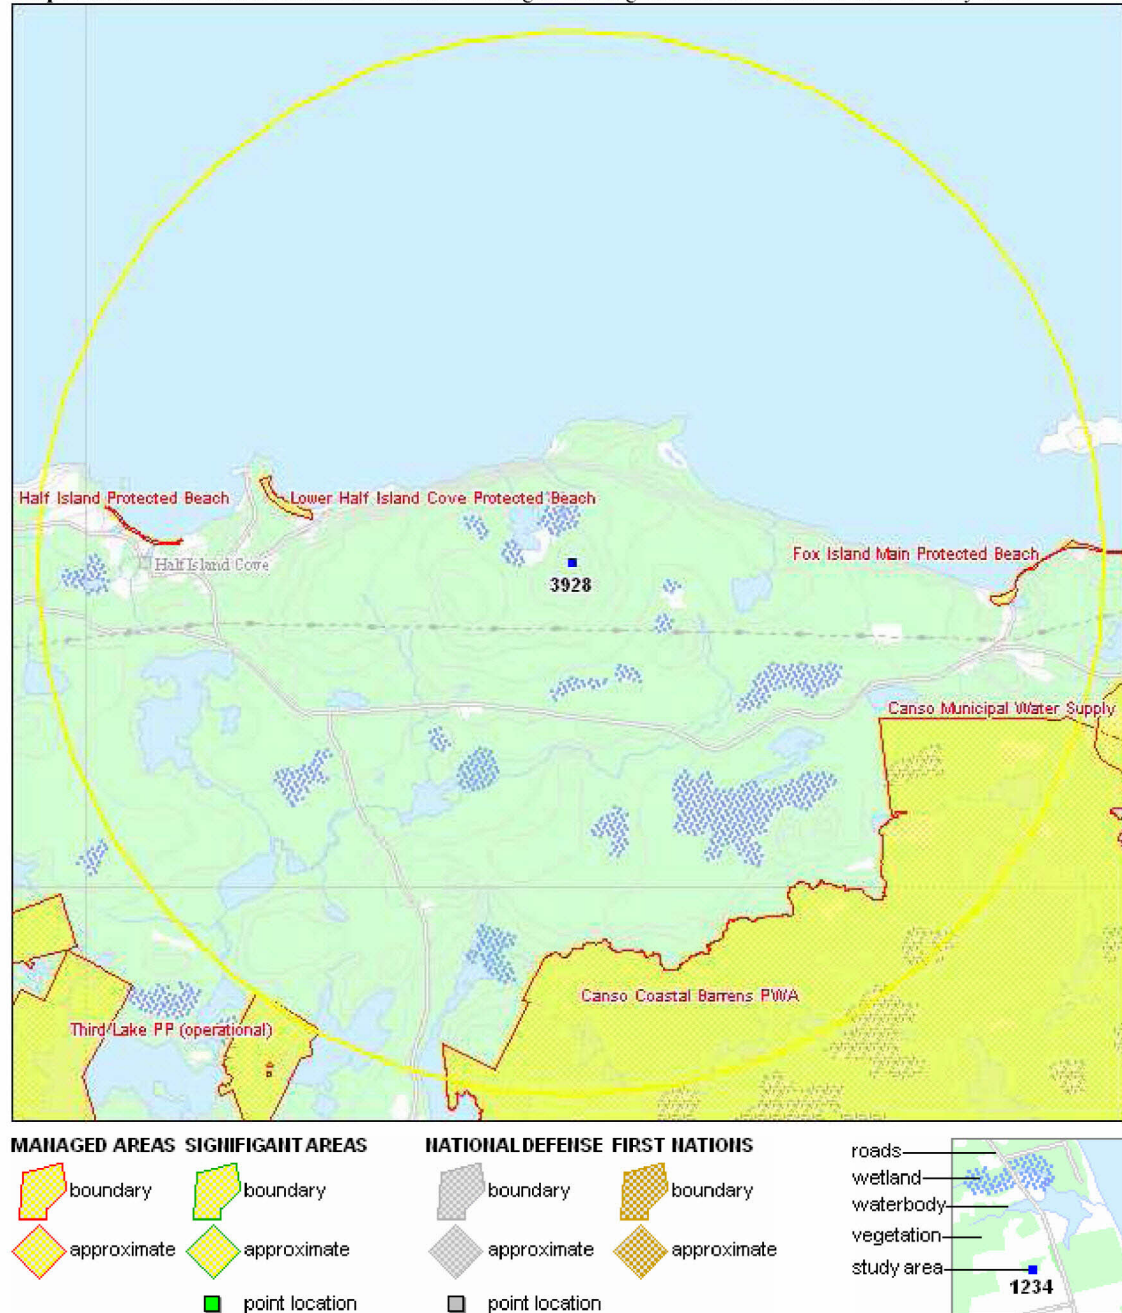

3.1 MANAGED AREAS

The GIS scan identified 5 Managed Areas with some degree of protected status, in the vicinity of the study area (see attached *ma.dbf).

3.2 SIGNIFICANT AREAS

No biologically significant areas identified.

Map 2: Boundaries and/or locations of known Managed and Significant Areas within 5km of study area.

4.0 TAXON LIST

Flora and fauna within the buffered area listed in order of concern, beginning with any legally listed taxa, including the number of observations per taxon and the distance in kilometers from study area centroid to the closest observation.

Scientific name	Common name	COSEWIC	Provincial	Srank	obs	dist.km
<i>Sterna dougallii</i>	Roseate Tern	E	Endangered	S1B	14	12 ±5

<i>Polygonum scandens</i>	Climbing False Buckwheat	S2	3	38 ±0
<i>Utricularia gibba</i>	Humped Bladderwort	S2	1	61 ±10
<i>Myriophyllum farwellii</i>	Farwell's Water Milfoil	S2	3	44 ±10
<i>Vaccinium uliginosum</i>	Alpine Bilberry	S2	2	74 ±10
<i>Vaccinium caespitosum</i>	Dwarf Bilberry	S2	1	74 ±10
<i>Vaccinium boreale</i>	Northern Blueberry	S2	9	21 ±1
<i>Shepherdia canadensis</i>	Soapberry	S2	7	80 ±0
<i>Crassula aquatica</i>	Water Pygmyweed	S2	3	38 ±10
<i>Triosteum aurantiacum</i>	Orange-fruited Tinker's Weed	S2	15	58 ±1
<i>Stellaria humifusa</i>	Saltmarsh Starwort	S2	3	77 ±0.1
<i>Draba arabisans</i>	Rock Whitlow-Grass	S2	1	76 ±1
<i>Betula michauxii</i>	Newfoundland Dwarf Birch	S2	5	49 ±0
<i>Betula borealis</i>	Northern Birch	S2	1	83 ±10
<i>Caulophyllum thalictroides</i>	Blue Cohosh	S2	4	43 ±0
<i>Impatiens pallida</i>	Pale Jewelweed	S2	7	44 ±1
<i>Senecio pseudoarnica</i>	Seabeach Ragwort	S2	6	22 ±0.1
<i>Erigeron philadelphicus</i>	Philadelphia Fleabane	S2	4	63 ±10
<i>Osmorhiza longistylis</i>	Smooth Sweet Cicely	S2	4	59 ±1
<i>Lampsilis radiata</i>	Eastern Lampmussel	S2	15	46 ±0.1
<i>Somatochlora septentrionalis</i>	Muskeg Emerald	S2	1	99 ±0.1
<i>Somatochlora forcipata</i>	Forcipate Emerald	S2	3	84 ±1
<i>Gomphus desertus</i>	Harpoon Clubtail	S2	7	50 ±0.1
<i>Nymphalis milberti</i>	Milbert's Tortoiseshell	S2	1	90 ±1
<i>Boloria chariclea</i>	Arctic Fritillary	S2	1	68 ±1
<i>Pieris oleracea</i>	Mustard White	S2	3	48 ±1
<i>Microtus chrotorrhinus</i>	Rock Vole	S2	1	73 ±10
<i>Salmo salar</i>	Atlantic Salmon	S2	60	23 ±10
<i>Picoides dorsalis</i>	American Three-toed Woodpecker	S2	1	83 ±5
<i>Rissa tridactyla</i>	Black-legged Kittiwake	S2	4	83 ±0.5
<i>Lycopodium hickeyi</i>	Hickey's Tree-clubmoss	S2?	1	91 ±0
<i>Juncus dudleyi</i>	Dudley's Rush	S2?	6	76 ±0
<i>Amelanchier fernaldii</i>	Fernald's Serviceberry	S2?	2	21 ±1
<i>Epilobium coloratum</i>	Purple-veined Willowherb	S2?	1	69 ±0.5

Symphyotrichum boreale	Boreal Aster	S2?	2	87 ±10
Scorpidium scorpioides	a Moss	S2?	1	44 ±10
Platycitrya jungermannioides	a Moss	S2?	1	73 ±0
Paludella squarrosa	a Moss	S2?	1	93 ±5
Cardinalis cardinalis	Northern Cardinal	S2B	2	44 ±5
Piranga olivacea	Scarlet Tanager	S2B	2	63 ±5
Hylocichla mustelina	Wood Thrush	S2B	3	31 ±5
Rallus limicola	Virginia Rail	S2B	2	45 ±5
Anas acuta	Northern Pintail	S2B	2	63 ±10
Bucephala clangula	Common Goldeneye	S2B,S4N	31	8 ±10
Tringa melanoleuca	Greater Yellowlegs	S2B,S5M	13	24 ±5
Calicris bairdii	Baird's Sandpiper	S2M	1	44 ±0.5
Branta bernicla	Atlantic Brant	S2M	1	8 ±10
Calicris maritima	Purple Sandpiper	S2N	11	8 ±10
Botrychium simplex	Least Moonwort	S2S3	1	86 ±1
Potamogeton zosteriformis	Flat-stemmed Pondweed	S2S3	4	82 ±10
Stuckenia filiformis ssp. alpina	Thread-leaved Pondweed	S2S3	9	59 ±1
Stuckenia filiformis	Thread-leaved Pondweed	S2S3	1	84 ±10
Poa glauca	Glaucous Blue Grass	S2S3	2	73 ±0
Alopecurus aequalis	Short-awned Foxtail	S2S3	4	44 ±0
Goodyera repens	Lesser Rattlesnake-plantain	S2S3	5	42 ±1
Cypripedium parviflorum	Yellow Lady's-slipper	S2S3	4	65 ±10
Lilium canadense	Canada Lily	S2S3	12	52 ±10
Carex hirtifolia	Pubescent Sedge	S2S3	3	43 ±0
Carex adusta	Lesser Brown Sedge	S2S3	1	83 ±5
Limosella australis	Southern Mudwort	S2S3	2	42 ±5
Geocaulon lividum	Northern Comandra	S2S3	1	24 ±10
Decodon verticillatus	Swamp Loosestrife	S2S3	1	54 ±5
Teucrium canadense	Canada Germander	S2S3	2	27 ±0.1
Hedeoma pulegioides	American False Pennyroyal	S2S3	1	87 ±5
Halenia ceflexa	Spurred Gentian	S2S3	4	18 ±5
Hypericum dissimulatum	Disguised St John's-wort	S2S3	1	28 ±1
Betula pumila	Bog Birch	S2S3	1	91 ±0.5
Symphyotrichum ciliolatum	Fringed Blue Aster	S2S3	1	70 ±10
Rudbeckia laciniata var. gaspereaensis	Cut-Leaved Coneflower	S2S3	1	68 ±10
Erigeron hyssopifolius	Hyssop-leaved Fleabane	S2S3	6	75 ±10
Asclepias incarnata ssp. pulchra	Swamp Milkweed	S2S3	5	65 ±1
Alasmidonta undulata	Triangle Floater	S2S3	4	23 ±0.1
Erynnis juvenalis	Juvenal's Duskywing	S2S3	1	69 ±1
Poecetes gramineus	Vesper Sparrow	S2S3B	3	43 ±5
Passerina cyanea	Indigo Bunting	S2S3B	1	54 ±5
Sayornis phoebe	Eastern Phoebe	S2S3B	9	37 ±5
Limosa haemastica	Hudsonian Godwit	S2S3M	4	44 ±0.5
Polygonum raii	Sharp-fruited Knotweed	S2S3SE	5	26 ±1
Schizaea pusilla	Little Curlygrass Fern	S3	3	4 ±1
Botrychium dissectum	Cut-leaved Moonwort	S3	1	80 ±1
Lycopodiella appressa	Southern Bog Clubmoss	S3	1	54 ±1
Isoteles acadensis	Acadian Quillwort	S3	1	4 ±1
Equisetum variegatum	Variegated Horsetail	S3	5	75 ±0
Dryopteris filix-mas	Male Fern	S3	8	44 ±1
Sparganium natans	Small Burreed	S3	4	56 ±0.5
Millium effusum var. cisatlanticum	Tall Millet Grass	S3	10	83 ±0
Dichanthelium clandestinum	Deer-tongue Panic Grass	S3	1	68 ±5
Platanthera orbiculata	Small Round-leaved Orchid	S3	2	54 ±5
Platanthera hookeri	Hooker's Orchid	S3	1	32 ±0.1
Platanthera grandiflora	Large Purple Fringed Orchid	S3	9	40 ±10
Listera convallarioides	Broad-Leaved Twayblade	S3	4	70 ±5
Goodyera tessellata	Checkered Rattlesnake-Plantain	S3	2	91 ±1
Corallorhiza trifida	Early Coralroot	S3	2	64 ±5
Trillium erectum	Red Trillium	S3	1	88 ±5
Luzula parviflora	Small-flowered Woodrush	S3	1	94 ±5
Carex eburnea	Bristle-leaved Sedge	S3	3	68 ±5
Carex bromioides	Bromelike Sedge	S3	8	39 ±0
Verbena hastata	Blue Vervain	S3	1	69 ±0.1
Laportea canadensis	Canada Wood Nettle	S3	2	39 ±0
Salix petiolaris	Meadow Willow	S3	1	59 ±0
Galium kamtschaticum	Northern Wild Licorice	S3	5	77 ±1
Rhamnus alnifolia	Alder-leaved Buckthorn	S3	10	39 ±0
Polygonum pensylvanicum	Pennsylvania Smartweed	S3	4	36 ±1
Epilobium strictum	Downy Willowherb	S3	3	45 ±0.5
Fraxinus nigra	Black Ash	S3	14	11 ±10
Bartonia virginica	Yellow Bartonia	S3	1	41 ±0.1
Stellaria longifolia	Long-leaved Starwort	S3	1	44 ±0
Packera paupercula	Balsam Groundsel	S3	3	73 ±0
Megalodonta beekii	Water Beggarticks	S3	5	67 ±0.5
Asclepias incarnata	Swamp Milkweed	S3	9	52 ±10
Panax trifolius	Dwarf Ginseng	S3	6	83 ±0
Amphiagron saucium	Eastern Red Damsel	S3	3	61 ±0.1
Sympetrum danae	Black Meadowhawk	S3	8	43 ±10
Nannothemis bella	Elfin Skimmer	S3	2	40 ±0.1
Gomphaeschna furcillata	Harlequin Darner	S3	2	40 ±0.1
Boyeria grafiana	Ocellated Darner	S3	2	87 ±1
Aeshna clepsydra	Mottled Darner	S3	2	41 ±0.1
Ophiogomphus carolus	Rifle Snaketail	S3	20	45 ±0.1
Lanthus parvulus	Northern Pygmy Clubtail	S3	5	63 ±1
Polygona faunus	Green Comma	S3	1	48 ±1

<i>Euphydryas phaeton</i>	Baltimore Checkerspot	S3	5	24 ±1
<i>Hesperia comma laurentina</i>	Laurentian Skipper	S3	2	77 ±1
<i>Hesperia comma</i>	Common Branded Skipper	S3	2	77 ±1
<i>Cepphus grylle</i>	Black Guillemot	S3	12	41 ±5
<i>Lycopodium sitchense</i>	Sitka Clubmoss	S3?	3	73 ±1
<i>Lycopodium sabinifolium</i>	Ground-Fir	S3?	4	76 ±1
<i>Lycopodium complanatum</i>	Northern Clubmoss	S3?	1	54 ±5
<i>Isoetes lacustris</i>	Lake Quillwort	S3?	12	4 ±1
<i>Cystopteris tenuis</i>	Mackay's Brittle Fern	S3?	5	46 ±5
<i>Sparganium fluctuans</i>	Floating Burreed	S3?	2	17 ±1
<i>Potamogeton richardsonii</i>	Richardson's Pondweed	S3?	4	48 ±5
<i>Potamogeton praelongus</i>	White-stemmed Pondweed	S3?	7	25 ±0.1
<i>Carex foenea</i>	Hay Sedge	S3?	1	92 ±0
<i>Salix pellita</i>	Satiny Willow	S3?	1	31 ±1
<i>Agrimonia gryposepala</i>	Hooked Agrimony	S3?	7	43 ±0
<i>Campanula aparinoides</i>	Marsh Bellflower	S3?	4	70 ±5
<i>Bidens connata</i>	Purple-stemmed Beggarticks	S3?	3	70 ±0.5
<i>Polygonia interrogationis</i>	Question Mark	S3B	2	48 ±1
<i>Icterus galbula</i>	Baltimore Oriole	S3B	5	37 ±5
<i>Dolichonyx oryzivorus</i>	Bobolink	S3B	62	13 ±5
<i>Mimus polyglottos</i>	Northern Mockingbird	S3B	9	11 ±5
<i>Coccyzus erythrophthalmus</i>	Black-billed Cuckoo	S3B	15	41 ±5
<i>Sterna paradisaea</i>	Arctic Tern	S3B	33	6 ±1
<i>Mergus serrator</i>	Red-breasted Merganser	S3B	39	8 ±10
<i>Numenius phaeopus</i>	Whimbrel	S3M	8	16 ±10
<i>Equisetum scirpoides</i>	Dwarf Scouring-Rush	S3S4	3	67 ±1
<i>Polystichum braunii</i>	Braun's Holly Fern	S3S4	12	47 ±1
<i>Cystopteris bulbifera</i>	Bulblet Bladder Fern	S3S4	10	32 ±1
<i>Sphenopholis intermedia</i>	Slender Wedge Grass	S3S4	12	57 ±0
<i>Spiranthes romanzoffiana</i>	Hooded Ladies'-Tresses	S3S4	14	12 ±1
<i>Liparis loeselii</i>	Loesel's Twayblade	S3S4	7	21 ±1
<i>Juncus nodosus</i>	Knotted Rush	S3S4	10	59 ±0
<i>Sisyrinchium angustifolium</i>	Narrow-leaved Blue-eyed-grass	S3S4	1	58 ±0
<i>Carex albicans</i> var. <i>emmonsii</i>	White-tinged Sedge	S3S4	2	9 ±0.1
<i>Lindernia dubia</i>	Yellow-seeded False Pimpernel	S3S4	1	43 ±0
<i>Lysimachia thyrsiflora</i>	Tufted Yellow Loosestrife	S3S4	1	38 ±0
<i>Polygonum robustius</i>	Stout Smartweed	S3S4	1	43 ±0
<i>Sanguinaria canadensis</i>	Bloodroot	S3S4	10	43 ±0
<i>Proserpinaca palustris</i> var. <i>crebra</i>	Marsh Mermaidweed	S3S4	4	38 ±0
<i>Myriophyllum sibiricum</i>	Siberian Water Milfoil	S3S4	1	91 ±0.1
<i>Polygonia progne</i>	Gray Comma	S3S4	3	48 ±1
<i>Speyeria aphrodite</i>	Aphrodite Fritillary	S3S4	2	69 ±100
<i>Calliphrys polios</i>	Hoary Elfin	S3S4	2	61 ±1
<i>Synaptomys cooperi</i>	Southern Bog Lemming	S3S4	1	73 ±10
<i>Loxia curvirostra</i>	Red Crossbill	S3S4	9	38 ±5
<i>Pluvialis dominica</i>	American Golden-Plover	S3S4M	3	44 ±0.5
<i>Didymodon fallax</i>	Fallacious Screw Moss	S4?	1	73 ±0
<i>Rhodobryum ontariense</i>	a Moss	S4S5	2	73 ±0
<i>Cratoneuron filicinum</i>	a Moss	S4S5	1	73 ±0
<i>Cyperus lupulinus</i> ssp. <i>macilentus</i>	Hop Flatsedge	SH	3	61 ±1
<i>Solidago simplex</i> var. <i>randii</i>	Sticky Goldenrod	SH	2	26 ±5

DATA REPORT 5173: Black Point, NS

Prepared 24 January, 2014
by J. Churchill, Data Manager

CONTENTS OF REPORT

1.0 Preface

- 1.1 Data List
- 1.2 Restrictions
- 1.3 Additional Information

2.0 Rare and Endangered Species

- 2.1 Flora
- 2.2 Fauna
- Map 1: Flora and Fauna

3.0 Special Areas

- 3.1 Managed Areas
- 3.2 Significant Areas
- Map 2: Special Areas

4.0 Rare Species Lists

- 4.1 Fauna
- 4.2 Flora

5.0 Source Bibliography

1.0 PREFACE

The Atlantic Canada Conservation Data Centre (ACCDC) is part of a network of NatureServe data centres and heritage programs serving 50 states in the U.S.A, 10 provinces and 1 territory in Canada, plus several Central and South American countries. The NatureServe network is more than 30 years old and shares a common conservation data methodology. The ACCDC was founded in 1997, and maintains data for the jurisdictions of New Brunswick, Nova Scotia, Prince Edward Island, and Newfoundland and Labrador. Although a non-governmental agency, the ACCDC is supported by 6 federal agencies and 4 provincial governments, as well as through outside grants and data processing fees. URL:

www.ACCDC.com.

Upon request and for a fee, the ACCDC queries its database and produces customized reports of the rare and endangered flora and fauna known to occur in or near a specified study area. As a supplement to that data, the ACCDC includes locations of managed areas with some level of protection, and known sites of ecological interest or sensitivity.

1.1 DATA LIST

Included datasets:

Filename	Contents
BlackPtNS_5173ob.xls	Rare and legally protected <i>Flora and Fauna</i> in your study area
BlackPtNS_5173bp.xls	Rare and common <i>Pelagic Birds</i> in your study area (CWS database)
BlackPtNS_5173sa.xls	All <i>Significant Natural Areas</i> in your study area

1.2 RESTRICTIONS

The ACCDC makes a strong effort to verify the accuracy of all the data that it manages, but it shall not be held responsible for any inaccuracies in data that it provides. By accepting ACCDC data, recipients assent to the following limits of use:

- a) Data is restricted to use by trained personnel who are sensitive to landowner interests and to potential threats to rare and/or endangered flora and fauna posed by the information provided.
- b) Data is restricted to use by the specified Data User; any third party requiring data must make its own data request.
- c) The ACCDC requires Data Users to cease using and delete data 12 months after receipt, and to make a new request for updated data if necessary at that time.
- d) ACCDC data responses are restricted to the data in our Data System at the time of the data request.
- e) Locations given for rare species records may be deliberately imprecise. Each record has an estimate of locational uncertainty, which must be referenced in order to understand the record's relevance to a particular location. Please see attached Data Dictionary for details.
- f) ACCDC data responses are not to be construed as exhaustive inventories of taxa in an area.
- g) The absence of a taxon cannot be inferred by its absence in an ACCDC data response.

1.3 ADDITIONAL INFORMATION

The attached file DataDictionary 2.1.pdf provides metadata for the data provided.

Please direct any additional questions about ACCDC data to the following individuals:

Questions on the biology of Federal Species at Risk can be directed to ACCDC: (506) 364-2657, with questions on Species at Risk regulations to: Samara Eaton, Canadian Wildlife Service (NB and PE): (506) 364-5060 or Julie McKnight, Canadian Wildlife Service (NS): (902) 426-4196.

For provincial information about rare taxa and protected areas, or information about game animals, deer yards, old growth forests, archeological sites, fish habitat etc., in New Brunswick, please contact Stewart Lusk, Natural Resources: (506) 453-7110.

For provincial information about rare taxa and protected areas, or information about game animals, deer yards, old growth forests, archeological sites, fish habitat etc., in Nova Scotia, please contact Sherman Boates, NSDNR: (902) 679-6146.

For provincial information about rare taxa and protected areas, or information about game animals, fish habitat etc., in Prince Edward Island, please contact Rosemary Curley, PEI Dept. of Agriculture and Forestry: (902) 368-4807.

2.0 RARE AND ENDANGERED SPECIES

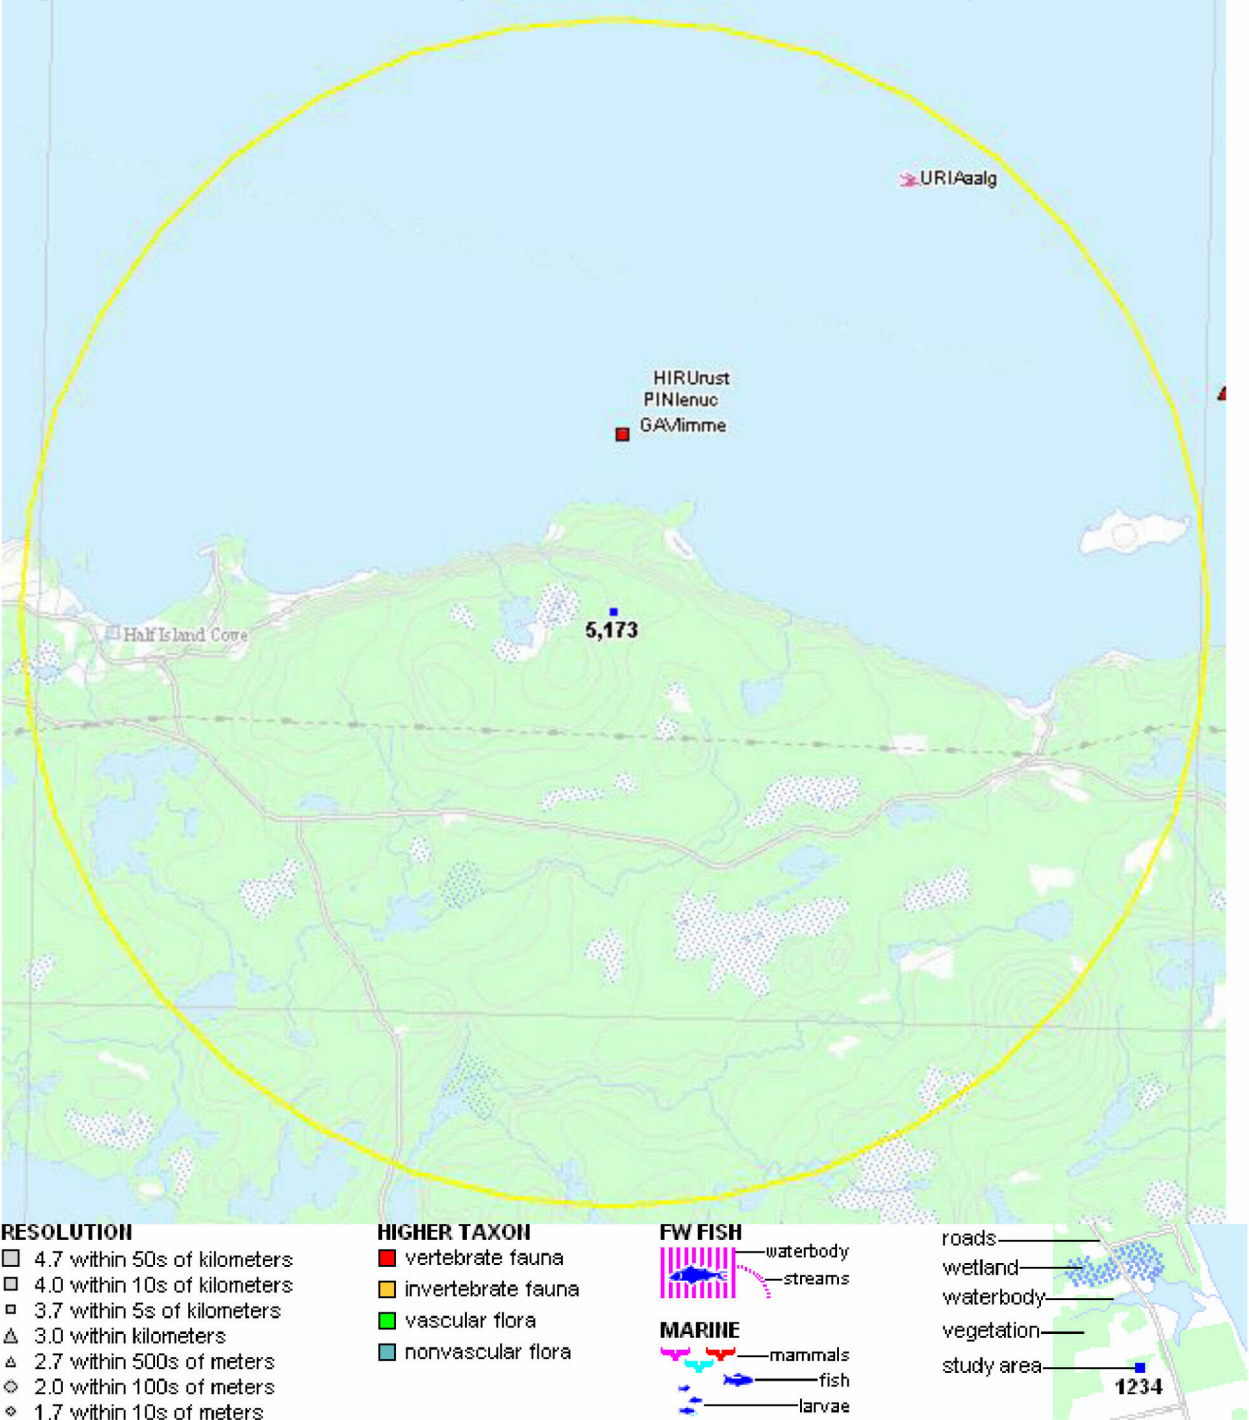

2.1 FLORA

A 5 km buffer around the study area contains no records of vascular, no records of nonvascular flora (Map 1 and attached: *ob.xls).

2.2 FAUNA

A 5 km buffer around the study area contains 4 records of 4 vertebrate, no records of invertebrate fauna (Map 1 and attached data files - see 1.1 Data List).

Map 1: Known observations of rare and/or protected flora and fauna within 5 km of the study area.

3.0 SPECIAL AREAS

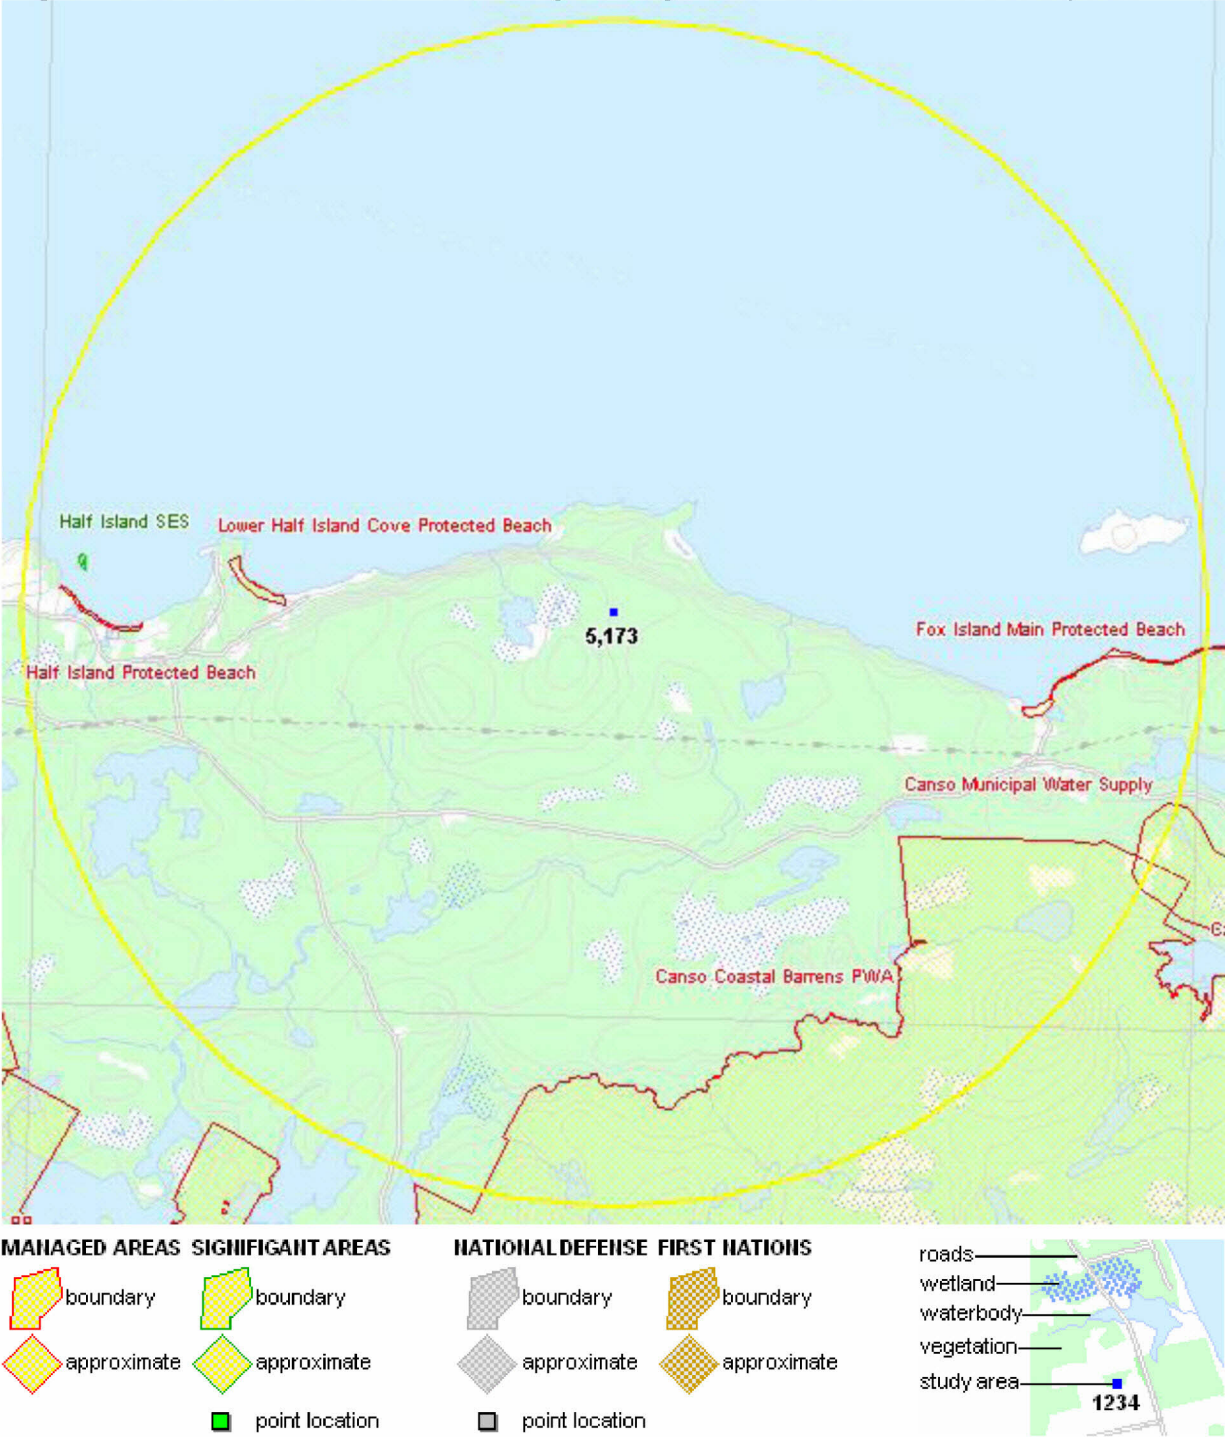

3.1 MANAGED AREAS

The GIS scan identified 5 managed areas in the vicinity of the study area (Map 2 and attached file: *ma*.xls)

3.2 SIGNIFICANT AREAS

The GIS scan identified 1 biologically significant site in the vicinity of the study area (Map 2 and attached file: *sa*.xls)

Map 2: Boundaries and/or locations of known Managed and Significant Areas within 5 km of the study area.

4.0 RARE SPECIES LISTS

Rare and/or endangered taxa within the buffered area listed in order of concern, beginning with legally listed taxa, with the number of observations per taxon and the distance in kilometers from study area centroid to the closest observation. [P] = vascular plant, [N] = nonvascular plant, [A] = vertebrate animal, [I] = invertebrate animal, [C] = community.

October 8, 2014

Beth Cameron
AMEC
Environmental and Infrastructure
50 Troop Ave, Unit 300
Dartmouth, NS B3B 1Z1

Dear Ms. Cameron:

**RE: Environmental Screening 14-09-22
Black Point Quarry**

Further to your request of September 22, 2014 staff at Communities, Culture and Heritage has reviewed their files for reference to the presence of heritage resources in the study area. Please be aware that our information is not comprehensive, and may include varying degrees of accuracy with respect to the precise location and condition of heritage resources.

It should be noted that the amount and degree of disturbance from previous developments could have a significant role in establishing the presence, absence or condition of heritage resources in this area.

Archaeological, Historical Sites and Remains

There are no recorded archaeological sites on file for the proposed study area. There are recorded archaeological sites, pre-contact and historic, to the west and east of the study area. The study area contains watercourses/waterbodies and has a large section along the coast. Historic maps indicate settlement.

It is recommended that an assessment for archaeological resources take place.

Botany

Staff has reviewed the records for plant species-at-risk in the Black Point area. The following species are ones of potential concern within the project area. The following plants are known from the vicinity of Black Point and should be considered prior to any development of the quarry or access roads.

Isoetes acadiensis (provincially yellow-listed)
Vaccinium ovalifolium (provincially orange-listed)

The presence/absence of the above species should be determined when identification is certain and the results should be stated in the final report. Please note that the Nova Scotia Museum

holds few records from this coast and it would be advisable to include a plant species inventory list as part of the field assessment.

Zoology

There are no records of zoological species with conservation implications in the foot-printed site.

There are, however, reports of nesting or potential nesting records of several bird species of concern within the immediate area.

Blue-winged Teal
Common Tern
Arctic Tern
Spotted Sandpiper
Willet
Common Loon
Gray Jay
Barn Swallow
Bank Swallow
Tree Swallow
Gray Catbird
Boreal Chickadee
Bay-breasted Warbler
Blackpoll Warbler
Tennessee Warbler
Wilson's Warbler
Ruby-crowned Kinglet
Golden-crowned Kinglet
Olive-sided Flycatcher
Yellow-bellied Flycatcher
Black-backed Woodpecker

Presence or absence of hibernating bats within the province is a potential concern due to the decimation of these populations due to White-Nose- Syndrome. There is little information on potential hibernacula in the outlined area, so if the geological features would support such sites, these should be investigated. Such structures could include caves (solution or fissure), abandoned mines, as well as abandoned fortifications with tunneling

It is recommended that the proponent also consult NSDNR with respect to wildlife species with special conservation concern such as Mainland Moose and Canada Lynx, as they would have more-specific data concerning possible presence within the area of the proposed development.

The adjacent marine waters may (seasonally) support resident or migratory species of Cetaceans as well as Marine Turtles. The majority of these do have some conservation concerns, but we note that these fall within the jurisdiction of the Federal Crown

Palaeontology

This project will disrupt rocks of the Meguma Supergroup (both the Goldenville Group and the Halifax Group) as well as a muscovite biotite monzogranite. No fossils are expected.

I have attached an invoice for the staff time spent reviewing our records and compiling this response. If you have any questions, please contact me at 424-6475.

Sincerely,

Sean Weseloh-McKeane
Coordinator, Special Places

Enclosure

ATTACHMENT E
Short List of Priority Species

Black Point Quarry Project
Guysborough County, NS
SLR Project No.: 210.05913.00000

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
VASCULAR PLANTS									
<i>Adiantum pedatum</i>	Northern Maidenhair- Fern				2- May Be At Risk	Yarmouth to north Cape Breton Island. Along Meander River.	In fertile or alkaline soils. Under oak-birch-sugar maple trees.	YES	NO
<i>Agalinis maritima</i>	Saltmarsh Agalinis/Salt- Marsh False-Foxglove				2- May Be At Risk	Salt marsh along the Argyle River at Argyle Head, Yarmouth County.	Salt marshes along the coast.	NO	NO
<i>Ageratina altissima</i>	White Snakeroot				2- May Be At Risk	A recording west of Advocate (North East NS), and unconfirmed near Antigonish.	Clearings, thickets, and moist woods.	Possibly	YES
<i>Allium schoenoprasum</i>	Wild Chives				2- May Be At Risk	Scattered in NS	Wet lowlands near the coast	Unlikely	YES
<i>Allium tricoccum</i>	Small White Leek				2- May Be At Risk	Cape Blomidon and Cambridge in Kings County. Kemptown in Colchester County. Beaman's Mountain in Digby County; and Inverness County.	Rich, deciduous forests and Intervals. (Hinds 2000: rich hardwoods and alluvial bottomlands.)	NO	NO
<i>Alnus serrulata</i>	Smooth Alder				3- Sensitive	Southwestern Nova Scotia.	Lakeshores	NO	NO
<i>Alopecurus aequalis</i>	Short-awned Foxtail				3- Sensitive	Top of Cape Blomidon, and from Cumberland County to Strathlorne and Margaree in Cape Breton.	The muddy edges of rivers and shallow ponds, and gravel margins.	YES	NO
<i>Amelanchier nantucketensis</i>	Nantucket Shadbush/Serviceberry				2- May Be At Risk	Southern coastal plains.	Cliff dweller, pine barrens, pond margins, fields, edges and thickets. Also in non-tidal river shore (non-forested and seasonally wet), roadside (non-forested wetland or upland). (www.dnr.state.md.us) (www.maineaturalareas.org)	NO	NO
<i>Anagallis minima</i>	Chaffweed				2- May Be At Risk	Sable Island- only location in Eastern Canada; cosmopolitan.	Muddy shores, with Sagina procumbens.	NO	NO
<i>Anemone americana</i>	Round-lobed Hepatica				2- May Be At Risk	Scattered throughout NS: from Bridgewater to Antigonish	Dry, usually mixed deciduous forests	YES	NO
<i>Anemone canadensis</i>	Canada Anemone				2- May Be At Risk	Near the sea at Cape Jack and Havre Boucher, Antigonish County. North of Cheticamp, at Presquille, Cape North, and Bay St. Lawrence, Cape Breton. Meander River area, Hants County, and Queens County.	Damp thickets, meadows, and gravelly shores, on calcareous or alluvial soils.	NO	NO
<i>Anemone multifida</i>	Cut-leaved Anemone				2- May Be At Risk	One colony found on north face of limestone cliff below waterfall at Corney Brook gorge in Inverness (var. <i>hudsonia</i>)	Shores and rocky banks on calcareous soil.	NO	NO
<i>Anemone parviflora</i>	Small-flowered Anemone				2- May Be At Risk	Cape Breton Highlands National Park, in Inverness County.	Wet limestone cliffs bordering waterfalls, gravelly bluffs.	NO	NO
<i>Anemone quinquefolia</i>	Wood Anemone				3- Sensitive	North of Bridgetown, Annapolis County. Newport, Hants County; and Middle Stewiacke, Colchester County. Two miles north of Sherbrooke, Guysborough County. Cape Breton.	Wooded riverbanks and shaded intervals.	YES	NO
<i>Anemone virginiana</i>	Virginia Anemone				3- Sensitive	Meander River in Hants County; Colchester and Pictou counties; Northern Cape Breton; Truro area.	Streamsides. Calcareous and slaty ledges, shores, and thickets.	YES	NO
<i>Antennaria parlinii</i>	Parlin's Pussytoes				2- May Be At Risk	Abundant along the LeHave River, Bridgewater. Gypsum cliffs of Halfway River in Hants County; several locations in Kings County.	Dry pine and oak forest, pastures, old fields and rocky banks.	NO	NO
<i>Antennaria rosea</i>	Rosy Pussytoes				2- May Be At Risk	Cape d'Or.	Likely restricted to exposed habitats like coastal cliffs (S.B. 2007)	NO	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Arabis drummondii</i>	Drummond's Rockcress				3- Sensitive	The head of the Bay of Fundy and northern Cape Breton. Hayfields in West New Annan, Colchester County.	Dry slopes and talus. Occasionally in fertile areas at lower elevations.	Unlikely	NO
<i>Arabis hirsuta</i>	Western Hairy Rockcress				2- May Be At Risk	Colchester, Victoria, and Cumberland Counties.	Dry cliffs, crevices, ledges, talus slopes and gravels.	NO	NO
<i>Arnica lonchophylla</i>	Northern Arnica				2- May Be At Risk	Waterfall at Grand Anse River (Inverness). Cliff edges at Big Southwest Brook (Victoria), and once in Richmond County.	Calcareous gravel ledges, cliffs.	Unlikely	NO
<i>Artemisia campestris</i>	Field Wormwood				2- May Be At Risk	Lockhart Brook, Salmon River, Victoria County.	Talus slopes in native habitats.	Unlikely	NO
<i>Asplenium trichomanes</i>	Maidenhair Spleenwort				3- Sensitive	rare and local in Northern Cape Breton. Locally common at Big Intervale, Margaree. Infrequent in mainland Nova Scotia except for scattered locations in Cobequid along with Annapolis and Kings counties.	Damp shaded cliffs, and talus slopes. Near acid rocks such as granite, basalt and sandstone.	Unlikely	Infrequent
<i>Asplenium viride</i> (syn. <i>Asplenium trichomanes-ramosum</i> L.)	Green Spleenwort				3- Sensitive	East branch of Five Islands River, Colchester County. Cumberland County and Cape Breton.	Shaded cliffs along streams, on limestone or other basic rocks.	Unlikely	NO
<i>Astragalus robbinsii</i>	Robbins' Milkvetch				2- May Be At Risk	Cape D'or and West Advocate in Cumberland County.	Cliff headlands.	NO	NO
<i>Baccharis halimifolia</i>	Eastern Baccharis	Threatened-No schedule	Threatened 2013	Threatened- November 2011 (New)	2- May Be At Risk	Southern Yarmouth County (S.B.)	Saltmarsh margins (S.B.) Upland fringes and Tidal Marshes. (http://www.springerlink.com/content/w2184516454610w6/)	NO	NO
<i>Betula glandulosa</i>	Glandular Birch				2- May Be At Risk	Twin Island Lake, Ingonish Barrens	Acidic, rocky barrens, crests, and summits.	NO	NO
<i>Betula michauxii</i>	Newfoundland Dwarf Birch				3- Sensitive	Brier Island east to Guysborough County. Also located in Cape Breton and Inverness counties.	Peat and sphagnum bogs.	YES	YES
<i>Betula minor</i>	Dwarf White Birch				3- Sensitive	Probably northerly.	Rocky slopes, barrens, and subalpine summits	NO	NO
<i>Betula pumila</i>	Bog Birch				3- Sensitive	Northern Victoria and Inverness counties. Black River, Inverness County at 60 m a.s.l.	Bogs and bog meadows. Mixed with alders of the same size.	NO	Infrequent
<i>Bidens beckii</i>	Water Beggarticks				3- Sensitive	Scattered throughout the province .Often abundant from Pictou to Cape Breton	Still or slow-moving waters	YES	NO
<i>Bidens hyperborea</i>	Estuary Beggarticks				2- May Be At Risk	River Philip, Oxford, Cumberland County. The estuaries at Antigonish, and Margaree, Inverness County.	Estuarine, on tidal mud flats.	Unlikely	NO
<i>Bistorta vivipara</i>	Alpine Bistort				2- May Be At Risk	Cape Breton	Moist to wet spruce or mixed woods along shorelines, moist subalpine woods and meadows, alpine meadows, heaths, nutrient-rich sites	NO	NO
<i>Blismopsis rufa</i>	Red Bulrush				2- May Be At Risk	Yarmouth County, and common in Northern Cape Breton.	Brackish marshes (Hinds)	NO	NO
<i>Boehmeria cylindrica</i>	Small-spike False-nettle				2- May Be At Risk	Le Have River, Annapolis River, Shubenacadie Wildlife Park, and another site in the general regions (S.B. 2014)	Wet alluvial woods or rocky shores	Possibly	NO
<i>Botrychium lanceolatum</i>	Triangle Moonwort				3- Sensitive	Kentville Ravine, Kings County. Colchester and Cumberland counties. Indian Brook, Cheticamp River, and Grand Anse in Northern Cape Breton.	Rich, wooded hillsides.	NO	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Botrychium lunaria</i>	Common Moonwort				2- May Be At Risk	New Campbellton and Indian Brook in northern Cape Breton Island. Also Halifax County on Conrad's Beach.	Open, turfy and gravelly slopes, shores, and meadows on basic soils.	YES	NO
<i>Botrychium simplex</i>	Least Moonwort				3- Sensitive	A number of locations from Yarmouth County to northern Cape Breton (gravelly beach at Cedar Lake, Yarmouth County; West Berlin, Queens County; Petpeswick, Halifax County; Antigonish, Victoria, and Inverness counties).	Lakeshores, or mossy edges of streams or waterfalls.	YES	Infrequent
<i>Bromus latiglumis</i>	Broad-glumed Brome				2- May Be At Risk	Yarmouth. Co. to northern Cape Breton	Alluvial Floodplain	YES	NO
<i>Calamagrostis stricta</i>	Slim-stemmed Reed Grass				3- Sensitive	Some lakes near Amherst. Reported at Beaver Lake, Yarmouth County. A larch bog at Big Baddeck, Cape Breton; and at Lockhart Brook, Salmon River, Cape Breton.	Around lakes and bogs, and wet cliff-faces.	Unlikely	Infrequent
<i>Callitriche hermaphroditica</i>	Northern Water-starwort				2- May Be At Risk	Once collected in Lunenburg County.	Quiet, calcareous or brackish waters.	NO	NO
<i>Caltha palustris</i>	Yellow Marsh Marigold				3- Sensitive	The coastal plain of northern Inverness County, near Mabou; Northeast Margaree; Margaree River; St. Joseph du Moine; Cheticamp; and occasionally near the mouth of Grand Anse Brook, Pleasant Bay. Merigomish Island, Pictou County.	Swamps, wet meadows, and wet rocks.	NO	NO
<i>Campanula aparinoides</i>	Marsh Bellflower				3- Sensitive	Cumberland and Hants counties to Antigonish County. One location in Cape Breton County.	Meadows, ditches and river banks.	YES	NO
<i>Cardamine maxima</i>	Large Toothwort				2- May Be At Risk	Isle Haute	Woodland streams or calcareous woods.	NO	NO
<i>Cardamine parviflora</i>	Small-flowered Bittercress				3- Sensitive	The Bay of Fundy from Brier Island to Cape Blomidon and Cape d'Or. Halifax County to Victoria County in Northern Central Cape Breton.	Dry woods, shaded or exposed ledges, and in sandy soils.	Unlikely	NO
<i>Cardamine pratensis</i>	Cuckoo Flower				2- May Be At Risk	Common along Annapolis river. Scattered along Atlantic coast and occasionally along roadsides as in central Cape Breton.	Meadows, low fields and moist areas.	YES	YES
<i>Carex adusta</i>	Lesser Brown Sedge				3- Sensitive	Uncommon and scattered in: Armdale, Halifax County, Victoria Park in Truro, Liscomb Mills Guysborough County, Black Brook and Warren Brook in Victoria County.	Dry open woods, gravels, rocks, and clearings. Also in acidic soils.	YES	YES
<i>Carex alopecoidea</i>	Foxtail Sedge				2- May Be At Risk	St. Georges Bay, east of Antigonish.	Moist, overgrown, clear-cut woods near coast	YES	Infrequent
<i>Carex atratiformis</i>	Scabrous Black Sedge				3- Sensitive	Fairly common in Northern Cape Breton. Only one mainland collection from McAsle Brook, Prospect Cumberland County.	Along river banks, moist cliffs and associated with rock crevices.	NO	NO
<i>Carex bebbii</i>	Bebb's Sedge				2- May Be At Risk	Both local and rare in Hants and Antigonish counties as well as central Cape Breton.	Northern alkaline regions in poorly drained areas.	YES	NO
<i>Carex capillaris</i>	Hairlike Sedge				3- Sensitive	Cape D'or in Cumberland County, and in Northern Cape Breton.	Seepy exposed slopes and cliff tops.	NO	NO
<i>Carex castanea</i>	Chestnut Sedge				2- May Be At Risk	Northern Cape Breton, and expected elsewhere.	Swamps and wet meadows, cliff crevices and ledges.	YES	Infrequent
<i>Carex chordorrhiza</i>	Creeping Sedge				2- May Be At Risk	Gisborne Vict. Co.	Bogs	NO	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Carex comosa</i>	Bearded Sedge				3- Sensitive	Scattered in Annapolis valley near McElmon's Pond in Debert. Local and abundant in Cumberland and Inverness counties. Northern mainland (S.B.2013)	Rich marshes (S.B. 2013)	YES	Infrequent
<i>Carex digitalis</i>	Slender Wood Sedge				2- May Be At Risk	Kejimikujik National Park	Dry, Sandy Woodlands.	NO	NO
<i>Carex ebumea</i>	Bristle-leaved Sedge				3- Sensitive	From Cumberland and Hants counties to Antigonish and Cape Breton.	Cliffs and talus slopes. Under conifers in calcareous soil.	YES	NO
<i>Carex garberi</i>	Garber's Sedge				2- May Be At Risk	St Paul Island CB Co., Black River Inv. Co.	Fen, river or stream	Unlikely	YES
<i>Carex gynocrates</i>	Northern Bog Sedge				2- May Be At Risk	St. Paul Island and bog at Black River, Inverness County.	Sphagnum bogs and coniferous swamps.	Unlikely	YES
<i>Carex haydenii</i>	Hayden's Sedge				2- May Be At Risk	Northern mainland (poorly known) (S.B., 2013)	Wet Meadows and rocky shores.	YES	Infrequent
<i>Carex hirtifolia</i>	Pubescent Sedge				3- Sensitive	Shubenacadie and Brookfield.	Calcareous regions in meadows and thickets on forest slopes.	Unlikely	NO
<i>Carex houghtoniana</i>	Houghton's Sedge				3- Sensitive	Scattered from Queens to Colchester counties.	Sandy soils and roadside banks.	Unlikely	NO
<i>Carex hystericina</i>	Porcupine Sedge				2- May Be At Risk	Uncommon and not noticed. Scattered in Kings County and possibly near Lake Ainslie in Cape Breton.	Swamps, swales and along brooks.	Unlikely	Infrequent
<i>Carex laxiflora</i>	Loose-flowered Sedge				2- May Be At Risk	Rarely seen; known from Annapolis, Hants and Kings counties as well as Ile Haute.	Damp clearings and open rocky woods.	NO	YES
<i>Carex livida</i>	Livid Sedge				2- May Be At Risk	Reported from Windsor, collected at Louisbourg, some in Richmond County.	Calcareous bogs and meadows.	Unlikely	NO
<i>Carex longii</i>	Long's Sedge				2- May Be At Risk	Yarmouth and Shelburne counties	Wet or seasonally wet, sandy soils, fields, thickets, ditches, pond edges, open woods, occasionally bogs	NO	NO
<i>Carex ormostachya</i>	Necklace Spike Sedge				2- May Be At Risk	Across NS (S.B)	Mostly located in rich hardwoods.	YES	NO
<i>Carex peckii</i>	Peck's Sedge				2- May Be At Risk	Across NS (S.B)	Uncommon on rocky slopes, clearing and dry woods, often on calcareous soils.	YES	Possible
<i>Carex pellita</i>	Woolly Sedge				2- May Be At Risk	East River, Pictou County, Wallace River, could be elsewhere (S.B.)	Calcareous and semi-calcareous	Possibly	NO
<i>Carex plantaginea</i>	Plantain-leaved Sedge				2- May Be At Risk	One collection in Brookside near Truro.	Dry hardwood hillsides.	Unlikely	NO
<i>Carex prairea</i>	Prairie Sedge				2- May Be At Risk	Centreville, Kings County	Typha swamps	NO	NO
<i>Carex rariflora</i>	Loose-flowered Alpine Sedge				2- May Be At Risk	Scatarie Island and Baleine in Cape Breton Island.	Fens, calcareous coastal heaths, bogs.	Unlikely	Infrequent
<i>Carex rostrata</i>	Narrow-leaved Beaked Sedge				2- May Be At Risk	Common throughout the province. Usually occupies moderately warm, wet sites.	Wet meadows, swales and around boggy pond margins.	YES	Infrequent

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Carex saxatilis</i>	Russet Sedge				2- May Be At Risk	Collected once in NS at Warren Lake, Victoria County.	Damp, peaty or gravelly soils.	NO	NO
<i>Carex scirpoidea</i>	Scirpuslike Sedge				3- Sensitive	Locally abundant in Cape Breton; Indian and Cheticamp rivers, Lockhart and Corney Books, as well as Big Intervale of Margaree.	Cliff ledges and crevices along rivers.	NO	NO
<i>Carex swanii</i>	Swan's Sedge				3- Sensitive	Local in Yarmouth County scattered east to Annapolis County.	Boggy pastures, dry peaty barrens, forests, clearing and edges.	NO	NO
<i>Carex tenera</i>	Tender Sedge				3- Sensitive	uncommon and not well known; Scattered Cumberland to Antigonish counties.	Meadows, woodlands, moist or dry openings.	YES	YES
<i>Carex tenuiflora</i>	Sparse-flowered Sedge				2- May Be At Risk	Little Harbour, Richmond County.	Wet woods and bogs	Unlikely	YES
<i>Carex tinctoria</i>	Tinged Sedge				2- May Be At Risk	West of Bay Field in St. Georges Bay, Inverness County.	Rich soils, at the edge of mixed woods.	NO	NO
<i>Carex tuckermanii</i>	Tuckerman's Sedge				2- May Be At Risk	Sweets Corner, Hants County, and along Wallace River in Cumberland County. Also Pugwash River.	Swales	Unlikely	Possible
<i>Carex wiegandii</i>	Wiegand's Sedge				2- May Be At Risk	Cape Breton, Port la Tour Bog in Shelburne County.	Boggy and peaty soils, conifer and alder swamps.	Unlikely	YES
<i>Caulophyllum thalictroides</i>	Blue Cohosh				2- May Be At Risk	Colchester County, Hants County, Kings County and Inverness County.	Deciduous Forests	Unlikely	NO
<i>Cephalanthus occidentalis</i>	Common Buttonbush				3- Sensitive	Shelburne County; Deception Lake and Lake John, Yarmouth County. Along the Medway River in Queens County.	Granite boulders, rocky shores, about lakes.	NO	NO
<i>Ceratophyllum echinatum</i>	Prickly Hornwort				2- May Be At Risk	Quite widespread at least from Yarmouth County to the northern mainland, generally away from acidic regions (S.B. 2014)	Fresh water of lakes, ponds, marshes, swamps;	Possibly	NO
<i>Chenopodium rubrum</i>	Red Pigweed				2- May Be At Risk	Common on Sable Island, Northumberland County and in Cape Breton.	Salt marshes, seashores and saline soils.	Unlikely	Infrequent
<i>Cinna arundinacea</i>	Sweet Wood Reed Grass				2- May Be At Risk	Sable Island	Alluvial Floodplain	NO	NO
<i>Clematis occidentalis</i>	Purple Clematis				2- May Be At Risk	One plant found in Amherst Point Bird Sanctuary.	Rocky, calcareous slopes and open woods.	NO	NO
<i>Clethra alnifolia</i>	Sweet Pepperbush		Vulnerable-2000	Threatened-May 2014 (In a higher risk category)	3- Sensitive	Digby County. Canoe Lake, Louis Lake and East Quinan in Yarmouth County. Also in Halifax (introduced).	Shores of Lake headwaters, sandy woods, swamps, thickets.	NO	NO
<i>Cochlearia tridactylites</i>	Limestone Scurvy-grass				2- May Be At Risk	Little-white Island and Big White Island in Halifax County.	Calcareous or brackish soils. Salt loving species	Unlikely	Infrequent
<i>Coeloglossum viride</i>	Long-bracted Frog Orchid				2- May Be At Risk	Sable Island. The northern tip of Cape Breton. Bay St. Lawrence, Victoria County. Black River Lake region, Kings County.	Boggy spots, damp mature woods. Fir or floodplain forests.	Unlikely	NO
<i>Comandra umbellata</i>	Bastard's Toadflax				2- May Be At Risk	Rare and Local in Northern Cape Breton; Sydney Mines, Black Point, a few clumps near South Pond, and Aspy Bay. Common at Pomquet Beach and Antigonish County.	Damp, sandy areas, dunes and exposed headlands; Open coniferous woods.	Possibly	YES
<i>Conioselinum chinense</i>	Chinese Hemlock-parsley				3- Sensitive	Digby Neck. St. Paul Island.	Swamps, mossy coniferous woods or swales, and seepy slopes near the coast.	NO	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region? <i>Conopholis americana</i>	American Cancer-root				2- May Be At Risk	Located along the LaHave River in Bridgewater, Belcher Street in Kentville, Queen's county and Lake Kedgemakooke in Kejimikujik National park. Also a report from Victoria Beach near Annapolis county.	Associated with Oaks and other deciduous trees.	NO	NO
<i>Coreopsis rosea</i>	Pink Coreopsis, Pink Tickseed		Endangered-2000	Endangered- November 2012 (No Change)	1- At Risk 1	Tusket valley (Yarmouth County).	Sandy or cobbly beaches, wet shores, and margins of lakes and streams. High wave energy shorelines.	NO	NO
<i>Cornus suecica</i>	Swedish Bunchberry				3- Sensitive	St. Paul Island , Scatarie Island, and Canso. Near Port Mouton, Queens County.	Sphagnum depressions in barrens, gravelly shores, and dry exposed headlands.	YES	YES
<i>Crassula aquatica</i>	Water Pygmyweed				3- Sensitive	Shelburne County: Peggy's Cove; Along the coast from Point Michaud to Scatarie Island, Cape Breton County and Richmond County. Locally near coast but often overlooked.	Brackish, muddy shore and muddy flats and borders of muddy ponds near the coast.	YES	Infrequent
<i>Crataegus flabellata</i>	Fan-leaved Hawthorn				3- Sensitive	Eastern NS and northern Cape Breton. Hants County and Kentville.	Hedgerows and thickets.	YES	NO
<i>Cryptogramma stelleri</i>	Steller's Rockbrake				2- May Be At Risk	Hillsborough and Waycobah, Inverness County. The region of Windsor.	Shaded limestone cliffs, and shaded crevices in conglomerate cliff-face.	Unlikely	NO
<i>Cuscuta cephalanthi</i>	Buttonbush Dodder				2- May Be At Risk	Luxuriant at Loch Broom, Pictou County; collected from Hubbards and Antigonish.	Low-lying ground near sea-shores, often parasitic on asters.	Unlikely	YES
<i>Cynoglossum virginianum</i>	Wild Comfrey				2- May Be At Risk	West of Kentville, and near Windsor; not common.	Open beech woods, on dryish soils or gypsum. Woods and thickets.	NO	NO
<i>Cyperus lupulinus</i> (syn. <i>C. filiculmis</i>)	Hop Flatsedge				2- May Be At Risk	Antigonish	Various well-drained, open places. Sandy beaches	YES	NO
<i>Cypripedium arietinum</i>	Ram's-Head Lady Slipper		Endangered-2007		2- May Be At Risk	St. Croix to Brooklyn in Hants County. PLUS Cumberland CO. location	Gypsum sinkholes.	NO	NO
<i>Cypripedium parviflorum</i>	Yellow Lady's-slipper				3- Sensitive	The Windsor-Brooklyn area of Hants County, sparingly west to Kings County, east to Cape Breton (Iona Area).	Calcareous soils, near outcrops of gypsum, or limestone. Occasionally in deciduous forests.	YES	NO
<i>Cypripedium reginae</i>	Showy Lady's-slipper				2- May Be At Risk	Hants and Cumberland Counties to Northern Cape Breton County.	Alkaline swamps and bogs	Unlikely	NO
<i>Cystopteris laurentiana</i>	Laurentian Bladder Fern				2- May Be At Risk	Collected in Victoria and Inverness counties- SEE FLORA NS Note on taxonomy	Cracks and ledges on cliffs, often on calcareous substrates	NO	NO
<i>Decodon verticillatus</i>	Swamp Loosestrife				3- Sensitive	Shelburne County and New Tusket, Digby County. Kejimikujik National Park.	Quaking margins of ponds or lakes.	NO	NO
<i>Desmodium canadense</i>	Canada Tick-trefoil				2- May Be At Risk	Lake Kejimikujik to rivers of Pictou County.	Open woods and river banks	Unlikely	NO
<i>Desmodium glutinosum</i>	Large Tick-trefoil				2- May Be At Risk	Rare. Halfway River in Hants County, Gaspereau River in Kings County, Kejimikujik National Park in Queens County.	Rich, deciduous forests.	NO	NO
<i>Diapensia lapponica</i>	Diapensia				2- May Be At Risk	Lockhart Brook, Salmon River in Victoria County. Upper Cheticamp River gorge above waterfalls.	In clumps on projecting shoulders, and in crevices of steep, north facing slopes.	NO	NO
<i>Dichanthelium linearifolium</i>	Narrow-leaved Panic Grass				3- Sensitive	Annapolis to Pictou County, also some recorded nearly 50 years ago in Coldbrook, Kings County.	Dry, sandy soils. (Hinds 2000: Sandy softwood groves and on gravel banks and roadsides)	Unlikely	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Dichanthelium xanthophyllum</i>	Slender Panic Grass				2- May Be At Risk	Collections from Bridgewater from over 50 years ago; no recent collections.	Open thickets in dry, rocky soil. (Hinds 2000: Sandy or rocky ground, or in open woods.)	NO	NO
<i>Dirca palustris</i>	Eastern Leatherwood				2- May Be At Risk	Milford Station in Hants County. St. Croix River near Newport in Hants County.	Rich Deciduous or mixed woods.	NO	NO
<i>Draba arabisans</i>	Rock Whitlow-grass				3- Sensitive	Cumberland and Kings Counties; Northern Cape Breton.	Muddy soils or calcareous rocks. Cliff crevices and ledges.	Unlikely	NO
<i>Draba glabella</i>	Rock Whitlow-grass				2- May Be At Risk	Head of Bay of Fundy, northern and eastern CB Island; Cape Blomidon, Kings County; Isle Haute cliffs; Cape D'Or, and on a high cliff at New Prospect cliffs, all in Cumberland County.	Crevices of cliff ledges and talus slopes.	NO	NO
<i>Draba norvegica</i>	Nonwegian Whitlow-grass				2- May Be At Risk	Lockhart Brook, Salmon River, Cape Breton.	On limestone on dry cliff ledges.	NO	NO
<i>Draba pycnosperma</i>	Dense Whitlow-grass				2- May Be At Risk	Lockhart Brook, Salmon River, Cape Breton.	On limestone on dry cliff ledges.	NO	NO
<i>Drosera filiformis</i>	Thread-leaved Sundew	Endangered- Schedule 1	Endangered 2000	Endangered May 2001 (No Change)	1- At Risk 1	Swaines Road bog, Quinns meadows, Port La Tour, West Baccaro bogs in Shelbourne County.	Nutrient poor peat bogs, peaty depressions, intermediate moisture.	NO	NO
<i>Dryopteris fragrans</i>	Fragrant Wood Fern				3- Sensitive	Between Earltown and Parrsboro. Along streams in Northern Cape Breton.	Dry overhanging cliffs, and in cliff crevices along streams or near waterfalls.	Unlikely	NO
<i>Eleocharis fallax</i>	Creeping Spikerush				2- May Be At Risk	Inverness County (probably from Bras d'Or Lake), but likely to occur anywhere in NS with suitable habitat (S.B. 2014)	Coastal, fresh to brackish tidal wetlands and ponds; and lakeshores, marsh	Possibly	NO
<i>Eleocharis flavescens</i>	Yellow Spikerush				3- Sensitive	Very local and mostly known from southwestern counties. Also occurs in Antigonish county.	Bogs, cold springs, dry stream banks, lake and pond margins, maritime mud flats, marshes, moist meadows, swamps;	YES	Infrequent
<i>Eleocharis ovata</i>	Ovate Spikerush				3- Sensitive	Common throughout the province.	Fresh, often drying shores, lake and stream beds, bogs, tidal estuaries, disturbed places;	YES	Possible
<i>Eleocharis quinqueflora</i>	Few-flowered Spikerush				2- May Be At Risk	Digby Neck, and central Cape Breton.	Alkaline bogs and occasionally on Maritime cliffs.	Unlikely	NO
<i>Eleocharis rostellata</i>	Beaked Spikerush				3- Sensitive	Southern western part of the province; Sand Beach, Tusket, Yarmouth County. Also Chebogue and Argyle along the coast of Digby County.	Confined to salt marshes and swales.	NO	NO
<i>Eleocharis tuberculosa</i>	Tuberclcd Spike-rush, Cone-cupped Spikerush	Special Concern- Schedule 1	Vulnerable-2013	Special Concern- April 2010 (In a lower risk category)	1- At Risk	Harper's Lake, Shelbourne County; Great Pubnico Lake, Yarmouth County.	Sandy or boggy lake margins, as found in coastal plain aras	NO	NO
<i>Elodea nuttallii</i>	Nuttall's Waterweed				2- May Be At Risk	Likely in southern Nova Scotia	Waters, mostly calcareous, of lakes and rivers;	NO	NO
<i>Elymus hystrix</i>	Spreading Wild Rye				2- May Be At Risk	Near Windsor, and in the Cobequid mountains.(Roland and Smith 1969)	Rich hardwoods and clearings.	NO	NO
<i>Elymus wiegandii</i>	Wiegand's Wild Rye				2- May Be At Risk	Sydney, Alma and River John, Pictou County.	Streambanks and meadows	Unlikely	NO
<i>Empetrum eamesii</i>	Pink Crowberry				3- Sensitive	Around the entire coast.	Exposed headlands on top of lichen-bearing rocks with thin soil.	YES	Infrequent

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Epilobium coloratum</i>	Purple-veined Willowherb				3- Sensitive	Scattered in mainland Nova Scotia, from Digby County to Guysborough.	Low-lying ground, springy slopes, and similar locations.	YES	Possible
<i>Epilobium hornemannii</i>	Hornemann's Willowherb				3- Sensitive	Northern Cape Breton.	Damp rocks, margins of rills, and similar locations.	NO	Possible
<i>Epilobium strictum</i>	Downy Willowherb				3- Sensitive	Scattered throughout Cape Breton. Infrequent from Cumberland County to Queens County.	Boggy areas and meadows.	Unlikely	YES
<i>Equisetum palustre</i>	Marsh Horsetail				2- May Be At Risk	Collected in Kings County	Marshes and swamps	NO	NO
<i>Equisetum pratense</i>	Meadow Horsetail				3- Sensitive	No existing collections. (S.B. 2007: rare but fairly widespread in northern Nova Scotia.)	Richer, calcareous soils primarily along river and stream floodplains, usually in fairly deep shade (S.B. 2007)(Hinds 2000: Open woods and wet meadows, usually in circumneutral soils).	Unlikely	NO
<i>Erigeron compositus</i>	Cut-leaved Fleabane				2- May Be At Risk	Northern Cape Breton (ibid.)	A northern species, likely found at a forest edge; likely habitats are cliffs and potentially river shores (S.B. 2007).	NO	NO
<i>Erigeron hyssopifolius</i>	Hyssop-leaved Fleabane				3- Sensitive	Hants County, near Antigonish, and northern Cape Breton.	Gypsum outcrops in central NS, or damp stream banks between flood levels. Banks, ledges, and cliff crevices in northern Cape Breton.	Unlikely	NO
<i>Erigeron philadelphicus</i>	Philadelphia Fleabane				3- Sensitive	Uncommon and scattered in Digby, Halifax and Antigonish counties as well as central Cape Breton.	Old fields, meadows and springy slopes.	Unlikely	Infrequent
<i>Eriophorum gracile</i>	Slender Cottongrass				3- Sensitive	Annapolis eastward.	Wet peat and inundated shores.	YES	YES
<i>Eutrochium dubium</i>	Coastal Plain Joe-pye-weed				2- May Be At Risk	Tusket Valley, and scattered east to Halifax and Lunenburg County.	Rocky shores, swamps and damp thickets.	Unlikely	Infrequent
<i>Fallopia scandens</i> (syn. <i>Polygonum scandens</i>)	Climbing False Buckwheat				3- Sensitive	Scattered throughout province	Low habitats	YES	YES
<i>Festuca prolifera</i>	Proliferous Fescue				3- Sensitive	Abundant at Grey Glen Brook and LeBlanc Brook, Victoria County	Cliff crevices	NO	NO
<i>Festuca subverticillata</i>	Nodding Fescue				2- May Be At Risk	Cape Blomidon, Kings County. Five Mile River in Hants County. Southern Cumberland County.	Rich, deciduous forest, alluvial woods.	Unlikely	NO
<i>Floerkea proserpinacoides</i>	False Mermaidweed			Not at Risk-April 1984 (New)	3- Sensitive	Glenora Falls and central Cape Breton. Antigonish County, Truro, and Sheffield Mills, Kings County.	Deciduous ravine slopes, river margins, and intervalle forests.	Unlikely	NO
<i>Fraxinus nigra</i>	Black Ash		Threatened		3- Sensitive	Digby and central Lunenburg Counties to northern Cape Breton. Scattered through northern part of NS.	Low ground, damp woods, and swamps.	YES	YES
<i>Fraxinus pennsylvanica</i>	Red Ash				2- May Be At Risk	Central Lunenburg County scattered near Mount Uniacke and at Lakeland in Hants County. (Northern Cape Breton ??)	Near lakes and pond or in other low lying areas.	YES	Infrequent
<i>Galium boreale</i>	Northern Bedstraw				2- May Be At Risk	Cumberland, Annapolis, and Kings County.	The edges of woods in grassy places like pastures.	NO	NO
<i>Galium labradoricum</i>	Labrador Bedstraw				3- Sensitive	Victoria, Inverness and Cape Breton counties.	Wet meadows and Alkaline bogs. Dune slacks and coastal bogs on PEI.	Unlikely	NO
<i>Galium obtusum</i>	Blunt-leaved Bedstraw				2- May Be At Risk	Coastal plains; Tusket Valley in Yarmouth county, in south western counties as well as near Rossignol area in Queens county.	Boggy swale and wet thickets.	NO	NO

Step 3- Possible Occurrence on Site based on habitats present
<i>Gentianella amarella</i>	Northern Gentian				2- May Be At Risk	Meat Cove Victoria County	Moist dunes, borders of abandoned dirt roads, hollows and calcareous ledges (Hinds, 2000)	NO	NO
<i>Geocaulon lividum</i>	Northern Comandra				3- Sensitive	Kingston, Kings County. Auburn, Kings County. Cape Breton and Spicer's Cove Cumberland County.	Sterile soils and damp sands, in acid or peaty areas.	Unlikely	Possible
<i>Geum peckii</i>	Eastern Mountain Avens	Endangered- Schedule 1	Endangered -2000	Endangered-April 2010 (No Change)	1- At Risk	Digby County, Digby Neck.	Boggy areas and sphagnum hummocks.	NO	NO
<i>Goodyera oblongifolia</i>	Menzies' Rattlesnake- plantain				3- Sensitive	Northern Cape Breton.	Deciduous climax forest. Slopes in damp, mixed forests, and ravines.	Unlikely	NO
<i>Goodyera pubescens</i>	Downy Rattlesnake- plantain				2- May Be At Risk	Melanson Mountain and Kentville in Kings County. Annapolis County near Eleven Mile Lake and South Milford.	Woodlands and thickets	NO	NO
<i>Goodyera repens</i>	Lesser Rattlesnake- plantain				3- Sensitive	Local but plentiful where found; Atlantic coast near Shelburne and Queens counties to Guysborough County. Scattered at the head of the Bay of Fundy and in northern Cape Breton.	Under conifers, growing typically on it's own.	YES	YES
<i>Gratiola neglecta</i>	Clammy Hedge-hyssop				3- Sensitive	Muddy swale at the Stewiacke River in Middle Stewiacke. The Hilden area, Colchester County.	Wet or muddy places.	NO	NO
<i>Halenia deflexa</i>	Spurred Gentian				3- Sensitive	Rare on mainland, spotted on Hall's Harbour in Kings County, and Sherbrooke in Guysborough County. Common in Northern Cape Breton and Scatarie Island.	Bleak exposed headlands.	YES	Unlikely
<i>Hedeoma pulegioides</i>	American False Pennyroyal				3- Sensitive	Common in the slopes of the Annapolis Valley. Scattered collection from Cumberland and Colchester counties westward.	Stony soil and upland pastures throughout northern NS, occasionally near seashores.	NO	NO
<i>Helianthus canadense</i>	Rockrose /Canada Frostweed		Endangered-2007		2- May Be At Risk	Sand plains between Aylesford and Middleton. Greenfield in Queens County.	Sand Barrens	NO	NO
<i>Hieracium robinsonii</i>	Robinson's Hawkweed				3- Sensitive	Big Intervale Inverness County, Tusket Island Yarmouth County, also Truro and Earltown Colchester County.	Rock crevices, cliffs, cobble shores and along streams.	Unlikely	Infrequent
<i>Hudsonia ericoides</i>	Pinebarren Golden Heather				3- Sensitive	Shelburne to Halifax Counties.	Dry, rocky and sandy barrens. Recently disturbed areas or on open sandy soils	NO	NO
<i>Hudsonia tomentosa</i>	Woolly Beach-heath				2- May Be At Risk	Near coast on sandy shore near Pictou and New Glasgow.	Sandy shores and dunes.	Unlikely	NO
<i>Hydrocotyle umbellata</i>	Water Pennywort	Special Concern- Schedule 1	Endangered-2001	Special Concern- May 2014 (In a lower risk category)	1- At Risk	Wilson's Lake in Yarmouth County. Lake Kejimikujik and George Lake in northern Queens County.	Wet, sandy, and gravelly lake margins.	NO	NO
<i>Hypericum dissimulatum</i>	Disguised St John's-wort				3- Sensitive	Potentially widespread (hybrid-derived taxon of two common spp.) (S.B. 2013);	On shores and in damp open areas (Hinds, 2000); mostly shores (S.B. 2013).	Possibly	Infrequent
<i>Hypericum majus</i>	Large St. John's-wort				2- May Be At Risk	Big Baddeck, Victoria County; and Halifax.	Wet or dry open soil. (Hinds 2000: damp open areas)	YES	YES
<i>Impatiens pallida</i>	Pale Jewelweed				3- Sensitive	Kings County to northern Cape Breton, becoming more frequent eastward. The slope of Isle Haute, Cumberland County.	Rich alluvial soils, damp thickets and along intervals.	YES	NO
<i>Iris prismatica</i>	Slender Blue Flag				2- May Be At Risk	Annapolis, Guysborough, and Inverness. Possibly Louisbourg.	Wet ground near the coast.	YES	Infrequent

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region? <i>Isoetes acadiensis</i>	Acadian Quillwort				3- Sensitive	Yarmouth County to northern Cape Breton. Lake Kejimikujik, near exit of Grafton Brook.	Water up to 1 m deep, bordering lakes or ponds, and occasionally along rivers.	YES	YES
<i>Isoetes prototypes</i>	Prototype Quillwort	Special Concern- Schedule 1	Vulnerable -2006	Special Concern- May 2005 (New)	3- Sensitive	Sutherland Lake in Cumberland County. Economy Lake in Colchester County. Pottle Lake in North Sydney. Sandy Lake in Annapolis County.	Dark water in nutrient poor acidic water	YES	NO
<i>Iva frutescens</i>	Big-leaved Marsh-elder				3- Sensitive	Kings County, Lunenburg County and northern Cape Breton Island	Mostly tidelands, brackish to saline marshes, beaches	Unlikely	NO
<i>Juncus acuminatus</i>	Sharp-fruited Rush				3- Sensitive	Local in Yarmouth County, scattered eastward to Lunenburg and Kings Counties. Infrequent northward to Cumberland County and in Baddeck in Cape Breton	Shores, swamps, ditches, springs, wet meadows, and rock outcrops; always near the coast	Unlikely	YES
<i>Juncus alpinoarticulatus</i>	Alpine Rush				2- May Be At Risk	Northern Cheticamp and Guysborough county	Wet meadows, sandy and gravelly, often calcareous shores, fens, and clayey pools over rock	YES	Possible
<i>Juncus brachycephalus</i>	Short-headed Rush				2- May Be At Risk	Reported from Yarmouth and Cape Breton, only collected from Seal Island, Yarmouth County	Calcareous marshes, wet meadows, and wetland shores;	Possibly	NO
<i>Juncus caesariensis</i>	New Jersey Rush	Special Concern- Schedule 1	Vulnerable -2001	Special Concern- May 2004 (No Change)	3- Sensitive	Gracieville, Richmond County. Lower L'Ardoise to Fourchu, Cape Breton County, and inland to Loch Lomond.	Bogs and fens along Cape Breton's southeastern coastal plain.	NO	NO
<i>Juncus dudleyi</i>	Dudley's Rush				3- Sensitive	Annapolis, Hants and Lunenburg counties.	Fields, roadsides and open thickets.	NO	NO
<i>Juncus greenei</i>	Greene's Rush				2- May Be At Risk	Halifax; near Pugwash, Cumberland County; Villagedale, Shelburne County; the dunes at Pomquet, Antigonish County.	Sandy soil and dune hollows.	Unlikely	NO
<i>Juncus marginatus</i>	Grass-leaved Rush				3- Sensitive	Yarmouth and Shelburne counties, north to Belleisle in Annapolis County.	Clayey roadsides, damp fields, and brooksides.	NO	NO
<i>Juncus secundus</i>	One-sided Rush				2- May Be At Risk	Collected once in both Queens and Kings counties	Usually in sterile, sandy or clay soil	NO	NO
<i>Juncus stygius</i>	Moor Rush				3- Sensitive	Gracieville, Richmond County. Isle Madame, and Louisbourg.	Wet moss, bogs, and bog pools.	Unlikely	Infrequent
<i>Juncus subcaudatus</i>	Woodland Rush				3- Sensitive	Southwestern mainland, scattered east to Kinsg and Halifax counties	Wet boggy woods and openings in spruce swamps	Unlikely	YES
<i>Juncus trifidus</i>	Highland Rush				3- Sensitive	Margaree, the Cheticamp River, Gray Glen Brook, and Lockhart Brook, all in Cape Breton.	Dry cliff crevices. North-facing cliffs in northern Cape Breton.	NO	NO
<i>Juncus vaseyi</i>	Vasey's Rush				2- May Be At Risk	Reported from Cumberland County	Cranberry bogs, and sandy lakeshore	NO	NO
<i>Lachnanthes caroliniana</i>	Redroot /Carolina Redroot	Special Concern- Schedule 1	Vulnerable -2013	Special Concern- November 2009 (In a lower risk category)	1- At Risk	Ponhook, Little Ponhook, Molega, Cameron, Hog, and Beartrap lakes, Queens County.	Peaty Shores and lakeside marshes	NO	NO
<i>Lactuca hirsuta</i>	Hairy Lettuce				3- Sensitive	Scattered to infrequent from Yarmouth and Shelburne counties to Kings and Halifax counties.	Dry open woods, and cut over areas.	Unlikely	YES
<i>Laportea canadensis</i>	Canada Wood Nettle				3- Sensitive	From Coldbrook, Kings County, to northwestern Cape Breton.	Alluvial woods of mixed or deciduous trees. Floodplains on Cape Breton plateau. Only the most fertile places.	YES	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Lilaeopsis chinensis</i>	Eastern Lilaeopsis	Special Concern- Schedule 1	Vulnerable-2006	Special ConcernMay 2004 (No Change)	3- Sensitive	Tusket River in Yarmouth County. La Have River in Lunenburg County. Medway River in Queens County.	Muddy and rocky tidal banks in estuaries.	NO	NO
<i>Lilium canadense</i>	Canada Lily				3- Sensitive	Kings and Cumberland counties to Middle River and Margaree in Cape Breton.	In meadows and in stream banks.	Unlikely	NO
<i>Limosella australis</i>	Southern Mudwort				3- Sensitive	The coast near Yarmouth and Shelburne counties. Near Wallace Lake on Sable Island. Cape Breton.	Low areas by ponds, gravel lakeshores, the muddy edges of ponds behind barrier beaches, and muddy river margins.	Unlikely	Infrequent
<i>Listera australis</i>	Southern Twayblade				2- May Be At Risk	Between Hay's River and Lake Ainslie Chapel, south of Inverness. Also one location in King's County and South Shore. Halifax International Airport. Scattered elsewhere	Sphagnum moss bogs or damp woods. Always near small spruce or tamarack.	YES	Infrequent
<i>Lobelia kalmii</i>	Brook Lobelia				2- May Be At Risk	Alkaline bog at Black River, Inverness County. A wet, quaking bog near McAdam Lake, Cape Breton County.	Dripping cliffs, meadows, and bogs. Usually in calcareous or marly locations.	Unlikely	NO
<i>Lobelia spicata</i>	Pale-spiked Lobelia				2- May Be At Risk	Locally abundant near Linden, Cumberland County; local and weedy on top of Cape Blomidon, Kings County.	Dry fields.	NO	NO
<i>Lophiola aurea</i>	Goldencrest	Threatened- Schedule 1	Vulnerable-2013	Special Concern- May 2012 (In a lower risk category)	1- At Risk	Southwestern counties.	Lakeshores, wet savannahs, and sphagnous swale.	NO	NO
<i>Luzula spicata</i>	Spiked Woodrush				2- May Be At Risk	St. Lawrence Bay, north of Cape Breton Is.	Exposed headland, over 300 m A.S.L.	NO	NO
<i>Malaxis monophyllus</i>	White Adder's-mouth				2- May Be At Risk	Rare and local - Recorded in Isle Haute, Cape Blomidon, and along the Five Island River, Colchester County, also found in Guysborough County.	Moss cushions and wet, mossy cliff edges, where there is little competition from other plant species	YES	Possible
<i>Minuartia groenlandica</i>	Greenland Stitchwort				3- Sensitive	Halifax and Lunenburg counties. Collected from rocks at Northwest Arm but not typical. Found in a gorge south of French Lake, Inverness County.	Granitic ledges and gravel. On coasts at higher elevations.	Unlikely	NO
<i>Montia fontana</i>	Water Blinks				2- May Be At Risk	Collected on a mossy bank above the sea on the Northwest Arm, Halifax. Brier Island. Port Hawkesbury, Inverness County. Burke Brook, Advocate, Cumberland County.	Springy or seepy slopes, wet shores and brackish spots.	Unlikely	Infrequent
<i>Myriophyllum tarwellii</i>	Farwell's Water Milfoil				3- Sensitive	Scattered across mainland NS.	Ponds and slow moving streams.	YES	NO
<i>Myriophyllum verticillatum</i>	Whorled Water Milfoil				3- Sensitive	Spring pools south of Amherst, Oxbow ponds near Antigonish and Cheticamp in northern Cape Breton. Also in Hants County.	Shallow waters, mainly in fine, muddy settlement or calcareous regions.	Unlikely	NO
<i>Najas gracillima</i>	Thread-like Naiad				2- May Be At Risk	Probably widely scattered in southern half of mainland	Muddy, peaty, or sandy ponds, pools and shores	NO	NO
<i>Ophioglossum pusillum</i>	Northern Adder's-tongue				3- Sensitive	Yarmouth and Digby Counties, east to Halifax and Amherst, George River in Cape Breton.	Sterile meadows, grassy swamps, and damp, sandy, or cobbly beaches of lakes.	Unlikely	NO
<i>Osmorhiza depauperata</i>	Blunt Sweet Cicely				2- May Be At Risk	Northern tip of Cape Breton around Bay St. Lawrence as well as in Wolfville.	Forests	NO	NO
<i>Osmorhiza longistylis</i>	Smooth Sweet Cicely				2- May Be At Risk	Scattered along North Mountain and Cape Blomidon in Kings County, directly north of Cumberland; Infrequent in Cape Breton.	Rich deciduous forests (intervals)	Unlikely	NO
<i>Oxyria digyna</i>	Mountain Sorrel				2- May Be At Risk	Restricted to Inverness County.	Dripping cliffs and rocky areas.	NO	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region? <i>Oxytropis campestris</i>	Field Locoweed, Northern Yellow Point- Vetch				2- May Be At Risk	St. Paul Island, north of Inverness County, Cumberland County.	Exposed cliff crevices, rocky or gravelly scree.	NO	NO
<i>Panicum rigidulum</i>	Redtop Panic Grass				3- Sensitive	Yarmouth County to Lake Kejimikujik. Along the Mersey River.	Sandy and peaty beaches. Gravelly lake margins.	NO	NO
<i>Panicum tuckermanii</i>	Tuckerman's Panic Grass				3- Sensitive	very widespread and spreading on roadsides;likely native on rivershores (esp. N mainland) and lakeshores Esp. SW). (S.B. 2014)	Floodplains, sandy shores, cranberry bogs	NO	NO
<i>Parnassia palustris</i>	Marsh Grass-of- Parnassus				2- May Be At Risk	Recorded in Mabou Harbour and northward in Cape Breton.	Grassy hollows in sand dunes and on tussocks in swamps	NO	NO
<i>Pedicularis palustris</i>	Marsh Lousewort				2- May Be At Risk	Specimens reported in Guysborough County, not common.	Marshes and meadows.	YES	Possible
<i>Persicaria arifolia</i> (<i>Syn. Polygonum arifolium</i>)	Halberd-leaved Tearthumb				3- Sensitive	widespread bu uncommon, Yarmouth to Cumberland Cty, plus one Cape Breton record which is likely correct (S.B. 2014)	Thickets, marshy borders usually under alders. It flourishes only in the richest alluvial soils	Possibly	NO
<i>Phleum alpinum</i>	Alpine Timothy				2- May Be At Risk	Along the Cheticamp River and LeBlanc Brook, Inverness County.	River ledges.	NO	NO
<i>Phyllodoce caerulea</i>	Blue Mountain Heather				2- May Be At Risk	Lockhart Brook, Salmon River in Victoria County.	Alpine rocks and peat.	NO	NO
<i>Pilea pumila</i>	Dwarf Clearweed				2- May Be At Risk	Seepage slope in rich maple-beech woods at West Branch, Pictou County.	Cool, moist, shaded places.	Unlikely	Possible
<i>Pinguicula vulgaris</i>	Common Butterwort				2- May Be At Risk	Cape Paul Island, Cheticamp River, Southwest Brook (Inverness). Corney Brook Gorge, South of French Lake.	Moist ledges, especially on limestone or shores.	No	NO
<i>Pipatherum canadensis</i> (<i>syn. Oryzopsis canadensis</i>)	Canada Rice Grass				3- Sensitive	Cumberland and Colchester counties. Near Porters Lake, Halifax County. Near Jordan Falls, Shelburne County.	Dry sandy soils.	NO	NO
<i>Pipatherum pungens</i> (<i>syn. Oryzopsis pungens</i>)	Slender Rice Grass				3- Sensitive	Shelburne County and southwestern Lunenburg County. Also reported from Mira Bay in Cape Breton.	Dry woods and clearings in sandy soils.	Unlikely	Possible
<i>Platanthera flava</i>	Tuberclad Orchid				3- Sensitive	Tusket River in Yarmouth County and Medway River in Queens County. Kings County and Kemptown region of Colchester County.	Sand or gravel beaches. Wet peat, and lake or river margins. Bogs, swamps, and meadows.	No	NO
<i>Platanthera macrophylla</i> (<i>syn. Platanthera orbiculata var. macrophylla</i>)	Large Round-leaved Orchid				3- Sensitive	Scattered from Hants County and the Cobequid region to northern Cape Breton.	Damp woods in deep shade	YES	Infrequent
<i>Poa glauca</i>	Glaucous Blue Grass				3- Sensitive	Cumberland County, Cape Breton, Cape Blomidon, and Isle Haute.	Cliff crevices, on shelves, and talus slopes.	Unlikely	NO
<i>Podostemum ceratophyllum</i>	Horn-leaved Riverweed				2- May Be At Risk	La Have River in Cumberland County. New Germany and Dog Falls in Lunenburg County.	Fast flowing gravelly streams.	NO	NO
<i>Polygala sanguinea</i>	Blood Milkwort				3- Sensitive	Cumberland, Annapolis, and Kings County.	Poor or acidic fields, damp slopes, and open woods or bush.	NO	NO
<i>Polystichum lonchitis</i>	Northern Holly Fern				3- Sensitive	Cape North, Bay St. Lawrence, south to Waycobah and River Denys in Cape Breton.	Alkaline areas. On or near limestone or gypsum in rocky areas, and cool shaded places.	Unlikely	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Potamogeton friesii</i>	Fries' Pondweed				2- May Be At Risk	Few reports from Kings, Inverness, and Colchester counties	Calcareous to brackish waters of lakes and slow-flowing streams	Unlikely	NO
<i>Potamogeton nodosus</i>	Long-leaved Pondweed				2- May Be At Risk	one record St. Mary's River, but id. needs checking (S.B 2014)	Pond and streams	Possibly	Possible
<i>Potamogeton oblongus</i>	Cinnamon-Spot Pondweed/ Oblong-leaved Pondweed				2- May Be At Risk	Only on Sable Island.	Freshwater ponds on Sable Island.	NO	NO
<i>Potamogeton obtusifolius</i>	Blunt-leaved Pondweed				3- Sensitive	Cumberland County to Pictou County to north/north central Cape Breton.	Ponds, lakes and slow moving streams, often on substrate of deep muck.	Unlikely	Infrequent
<i>Potamogeton praelongus</i>	White-stemmed Pondweed				3- Sensitive	Kings County to Cape Breton	Usually in deep water	YES	NO
<i>Potamogeton pulcher</i>	Spotted Pondweed		Vulnerable-2013		2- May Be At Risk	Uncommon from Upper Musquidoboit River to Queens and Digby counties	Muddy lake margins or brook beds	YES	NO
<i>Potamogeton richardsonii</i>	Richardson's Pondweed				2- May Be At Risk	Scattered form Kings and Colchester counties to Cape Breton	Lakes and Rivers, in brackish or alkaline waters	YES	NO
<i>Potamogeton zosteriformis</i>	Flat-stemmed Pondweed				3- Sensitive	Rare in Kings, Colchester, Cumberland, and Halifax counties. Mouth of the Hays River, Inverness County.	Lakes and deep rivers in less acid regions.	Unlikely	NO
<i>Prenanthes racemosa</i>	Glaucous Rattlesnakeroot				2- May Be At Risk	Isle Haute Yarmouth County, along the Atlantic coast to Cape Breton County.	Alpine locations and barrens around the coast.	YES	NO
<i>Primula mistassinica</i>	Mistassini Primrose				3- Sensitive	Common on a bank along Salmon River Truro, Upper Stewiacke Colchester County, and scattered in northern Cape Breton.	Springy stream banks and dripping ledges.	Unlikely	NO
<i>Proserpinaca intermedia</i> (* Hybrid of <i>Proserpinaca pectinata</i>)	Intermediate Mermaidweed				2- May Be At Risk	Boggy Savannah by Butlers Lake Gavelton Yarmouth County, also scattered in south western NS.	In small depressions which are damp or partially filled with water.	NO	NO
<i>Proserpinaca pectinata</i>	Comb-leaved Mermaidweed				3- Sensitive	Scattered throughout mainland NS	Wet savannahs, sphagnous swales, and the sandy, gravelly, or muddy borders of lakes or ponds	YES	Possible
<i>Pyrola minor</i>	Lesser Pyrola/Lesser Wintergreen				3- Sensitive	Scattered north from Digby Neck to Kentville and east Cape Breton.	Mature coniferous woods in northern Cape Breton.	Unlikely	Infrequent
<i>Ranunculus pensylvanicus</i>	Pennsylvania Buttercup				2- May Be At Risk	Northern mainland (S.B.2013)	Muddy shores and moist meadows (Hinds 2000). Richer moist shores and sometimes disturbed ground (S.B.)	YES	Possible
<i>Ranunculus sceleratus</i>	Cursed Buttercup				2- May Be At Risk	Local and rare; Damp roadside at Barrie Beach, edge of marsh at McNabs Island, brackish pond in Eastern Passage Halifax County. Abundant in the water of a swamp pond at Main-a-Dieu Cape Breton County, and on the beach at West Berlin in Queens County.	Pools and rills from brackish to freshwater habitat.	Unlikely	Infrequent
<i>Rhamnus alnifolia</i>	Alder-leaved Buckthorn				3- Sensitive	Central Nova Scotia and southern Inverness County.	Swampy woods and boggy meadows. Alkaline areas, near limestone or in marl bogs in rich, alluvial soil. Poorly drained swamps in Cape Breton.	Unlikely	NO
<i>Rhododendron lapponicum</i>	Lapland Rosebay				2- May Be At Risk	Comey Brook Gorge in the Cape Breton Highlands National Park, Inverness County.	In the one instance found, limited to a single calcareous ledge in a gorge.	NO	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Rhynchospora capillacea</i>	Slender Beakrush				2- May Be At Risk	Southern end of Lake Ainslie at Black River and in the Baddeck Bay region.	Alkaline bogs	Unlikely	NO
<i>Rhynchospora macrostachya</i>	Tall Beakrush			under Review	2- May Be At Risk	2 sites in the Bridgewater- Kejimikujik area: Molega Lake, Carrigan Lake; the only sites in Canada (S.B. 2014)	Acidic sunny wetlands, mostly pond shores, seeps, bogs, marshlands;	NO	NO
<i>Rudbeckia laciniata</i>	Cut-leaved Coneflower				3- Sensitive	Kings County. Isolated from Annapolis and Cumberland counties to Guysborough County.	Swales, the edges of swamps or in gullies, in small colonies.	YES	Infrequent
<i>Rumex persicarioides</i>	Peach-leaved Dock				2- May Be At Risk	Infrequent. Cumberland, Queens, Inverness and/or Victoria counties. Sable Island	Mostly coastal and slightly saline riparian habitats: shores, marshes	Unlikely	NO
<i>Rumex triangulivalvis</i>	Triangular-valve Dock				3- Sensitive	Sweets Corner, Hants county, and River Inhabitants, Inverness county. Also in Kentville.	Coastal sands, shores, and gravel roadsides	Unlikely	YES
<i>Sabatia kennedyana</i>	Plymouth Gentian	Schedule 1 - Threatened	Endangered-2013	Endangered- November 2012 (In a higher risk category)	1- At Risk	Tusket River Valley in Yarmouth County.	Cobbly, Sandy Beaches, and peaty margins of lakes, rivers and boggy savannahs.	NO	NO
<i>Salix candida</i>	Sage Willow		Endangered-2013		2- May Be At Risk	Black River fen in Inverness; record from Halifax County was wrong (S.B.2014)	Calcareous bogs and thickets	NO	NO
<i>Salix glauca</i> (<i>Salix glaucophylloides- var. of S.myricoides</i>)	Gray Willow				2- May Be At Risk	Northern Cape Breton	Sandy and gravelly shores adjacent to thickets.	NO	NO
<i>Salix pedicellaris</i>	Bog Willow				3- Sensitive	From Digby County to Cape Breton. Uncommon near the Atlantic coast, and not known in northern Cape Breton.	Swampy thickets, poorly drained soils, bogs, and heavy soils.	YES	YES
<i>Salix reticulata</i>	Net-veined Willow				2- May Be At Risk	Only in Corney Brook gorge in Inverness.	Calcareous Barrens and cliffs.	NO	NO
<i>Salix sericea</i>	Silky Willow				2- May Be At Risk	Western Nova Scotia. Scattered east to Shubenacadie Grand Lake. Brier Island.	Low thickets and streambanks.	NO	NO
<i>Salix uva-ursi</i>	Bearberry Willow				2- May Be At Risk	Cape Breton Island, St. Paul Island, Corney Brook gorge, Cape Breton Highlands park, Inverness County.	Barrens and subalpine areas. On calcareous ledges.	NO	NO
<i>Salix vestita</i>	Hairy Willow				2- May Be At Risk	Corney Brook Gorge in Inverness.	Humid, north facing crevices on cliffs in calcareous soil.	NO	NO
<i>Samolus valerandi</i>	Seaside Brookweed				3- Sensitive	From Tusket River, Yarmouth to Bridgewater. Also Antigonish.	Brackish meadows, and tidal banks. Edge of salt marshes.	Unlikely	NO
<i>Sanicula odorata</i>	Clustered Sanicle				2- May Be At Risk	Five Mile River, Hants County; Cornwallis River at Cambridge, Kings County; West River, Pictou County; Southwest Margaree, Inverness County.	Rich alluvial woods and Intervales. (S.B. (2007): Only the richest intervale forest habitats.)	Unlikely	NO
<i>Saxifraga aizoides</i>	Yellow Mountain Saxifrage				2- May Be At Risk	Big Southwest Brook, south of French Lake at Corney Brook gorge, Cape Breton Highlands.	Dripping cliffs. Within spray of waterfalls on north facing limestone ledges.	NO	NO
<i>Saxifraga cernua</i>	Nodding Saxifrage				2- May Be At Risk	Blair R., Inverness County (S.B. 2014)	Cool, wet areas, mossy banks, tundra, shady rock faces, late snowbeds;	NO	NO
<i>Saxifraga oppositifolia</i>	Purple Mountain Saxifrage				2- May Be At Risk	Corney Brook gorge in Cape Breton Highlands.	Seepage area on partly shaded rock face.	NO	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Saxifraga paniculata</i>	White Mountain Saxifrage				3- Sensitive	Cape Blomidon. Cape d'Or and northern Cape Breton.	Pockets in cliffs, mossy hillsides, dripping cliffs, and limestone ledges.	NO	NO
<i>Schoenoplectus americanus</i> (SYN. <i>Scirpus americanus</i>)	Olney's Bulrush				3- Sensitive	Common	Brackish marshes, and sometime in bogs near the coast. Forms colonies on wet sand around depressions were sand is rather salty.	Possibly	Possible
<i>Schoenoplectus torreyi</i>	Torrey's Bulrush				2- May Be At Risk	Lunenburg and Queens counties	Emergent in fresh ponds and marshes, often with fluctuating water levels	NO	NO
<i>Scirpus longii</i>	Long's Bulrush	Schedule 3-Special Concern	Vulnerable -2001	Special Concern- April 1994 (New)	3- Sensitive	Ponhook Lake and Moosehorn Lake, Queens County. Also Eighteen Mile Brook, Shingle Lake, Dunraven Fen, and Quinn's Meadow, Shelburne County.	Peaty or mucky shores of lakes in the southwest. Stillwater meadows, and ferns.	NO	NO
<i>Selaginella rupestris</i>	Rock Spikemoss				2- May Be At Risk	The Ledges of Shobel's Mountain and Sandy Cove in Digby County. An outcrop in Centerville on Digby Neck.	Dry exposed rocks and sandy soils.	NO	NO
<i>Selaginella selaginoides</i>	Low Spikemoss				2- May Be At Risk	Brier Island. Scattered in Cape Breton	Moist areas bordering bog tussocks, peat bogs, and stream margins	Unlikely	YES
<i>Senecio pseudoarnica</i>	Seabeach Ragwort				3- Sensitive	Scattered along Atlantic coast to Northern Cape Breton.	Gravelly seashores.	YES	YES
<i>Shepherdia canadensis</i>	Soapberry/Canada Buffalo-Berry				3- Sensitive	The roadside between Windsor and Brooklyn, and in northern Cape Breton.	Gypsum or talus slopes. Along the coast in the reach of salt spray. Grows with Shrubby Cinquefoil and <i>Senecio pauperculus</i> .	Unlikely	NO
<i>Silene acaulis</i>	Moss Champion				2- May Be At Risk	Abundant at south west end of St.Paul Island, south of Northeast Channel practically at sea-level.	Gravelly, rocky or turfy cool barrens as well as coastal cliffs.	NO	NO
<i>Silene antirrhina</i>	Sleepy Catchfly				2- May Be At Risk	Annapolis Valley (S.B., 2007)	Sand barren habitat (S.B., pers.com. 2007). Dry railways and roadways, also in open woods and fields (Hinds 2000).	NO	NO
<i>Sisyrinchium fuscatum</i>	Coastal Plain Blue-eyed- grass				2- May Be At Risk	Scattered in southern half of mainland	Sandy plains or banks	NO	NO
<i>Solidago hispida</i>	Hairy Goldenrod				2- May Be At Risk	Infrequent and only occasionally seen Digby, Yarmouth, Halifax counties	Dry wooded banks and rocky shores.	Unlikely	NO
<i>Solidago multiradiata</i>	Multi-rayed Goldenrod				2- May Be At Risk	St.Paul Island in Northern Cape Breton, rare but located at Big Southwest Brook along the Cheticamp River as well as Corney Brook in Inverness County.	Restricted to arctic habitat; Barrens , ledges and mostly shaded cliffs.	NO	NO
<i>Sparganium hyperboreum</i>	Northern Burreed				3- Sensitive	Cape Breton. New Harbour, Guysborough County.	Peaty pools.	YES	YES
<i>Spiranthes casei</i>	Case's Ladies'-tresses				3- Sensitive	Southwestern counties; Jordon Falls to Pubnico and Bellville.	Acid sandy soils, roadsides and open barrens.	NO	NO
<i>Spiranthes lucida</i>	Shining Ladies'-tresses				2- May Be At Risk	Northumberland Strait from Pictou County to Cheticamp, also in Kings, Annapolis and Yarmouth counties.	Alluvial soils and damp rocky shores as well as thickets and meadows.	Unlikely	infrequent
<i>Spiranthes ochroleuca</i>	Yellow Ladies'-tresses				3- Sensitive	Southwestern of Nova Scotia, northeast to West Gore, Hants County.	Driest sand barrens in southwestern counties. Near rivers, and in dry habitats like roadsides and fields.	NO	NO
<i>Stellaria crassifolia</i>	Fleshy Stitchwort				2- May Be At Risk	Tannery Pond near Wolfville. Possibly scattered in the northern part of NS.	Spring rills and the edges of ponds.	Unlikely	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Stellaria humilusa</i>	Saltmarsh Starwort				3- Sensitive	Cumberland, Colchester and Guysborough counties. Shoreward reaches of salt marshes in Cape Breton.	Around salt marshes.	YES	NO
<i>Stellaria longifolia</i>	Long-leaved Starwort				3- Sensitive	The meadow along the Salmon River, Truro, and in neighbouring gardens. From the Musquodoboit and Stewiacke River valleys; Kemptown; Colchester County; Ilse Haute.	Damp or wet grassy places, in sandy to muddy soils.	Unlikely	NO
<i>Suaeda rolandii</i>	Roland's Sea-blite				2- May Be At Risk	Found at bays near the head of the Bay of Fundy; Avenport in Kings County, Sweets Corner in Hants County, and Economy in Colchester County. Also the Amherst marsh in Cumberland County.	Salt marshes and saline shores.	NO	NO
<i>Symphyotrichum boreale</i>	Boreal Aster				3- Sensitive	Scattered from Yarmouth to Cape Breton (Rather uncommon).	Gravelly soil and lake beaches, along streams and the edges of bogs.	YES	Possible
<i>Symphyotrichum ciliolatum</i>	Fringed Blue Aster				3- Sensitive	Scattered from southern Hants County to adjacent Colchester County and to Musquodoboit to Halifax County. Also Ile Haute in Cumberland County, Cape Breton and Guysborough Counties.	Open fields, lawns and edges of woods.	YES	NO
<i>Symphyotrichum undulatum</i>	Wavy-leaved Aster				3- Sensitive	Widely scattered in Lunenburg County and from there to Kings, Queens and Halifax counties.	Old fields and edges of thickets.	Unlikely	NO
<i>Teucrium canadense</i>	Canada Germander				3- Sensitive	widespread but uncommon on the coast throughout, except extreme north CB (S.B2014)	Gravel seacoasts, the crest of the beach, beyond the reach of the tide.	Possibly	Infrequent
<i>Thuja occidentalis</i>	Eastern White Cedar				1- At Risk 1	Annapolis, Digby and Cumberland Counties.	Lakesides and swamps or old pastures.	NO	NO
<i>Tiarella cordifolia</i>	Heart-leaved Foamflower				3- Sensitive	Colchester and Pictou counties. Huntington Point, Kings County.	Deciduous forests and gravelly roadsides.	Unlikely	NO
<i>Toxicodendron vernix</i>	Poison Sumac				2- May Be At Risk	Tefler Lake in Queens County.	Swampy lakeshores and marshy areas.	NO	NO
<i>Triantha glutinosa</i>	Sticky False Asphodel				2- May Be At Risk	Black River bog and Cheticamp in Inverness.	Swamps, bogs and rocky beaches.	NO	NO
<i>Triosteum aurantiacum</i>	Orange-fruited Tinker's Weed				3- Sensitive	Rare above Truro. Found in Kemptown in Colchester County. Also near New Glasgow. Meander River, and also in north Cape Breton.	Rich soils along rivers. Limestone banks in one location	Unlikely	NO
<i>Trisetum melicoides</i>	Purple False Oats				2- May Be At Risk	Indian Brook, Victoria County; Digby County, Cumberland County to Pictou County.	Gravel shores and banks, especially alkaline areas.	Unlikely	NO
<i>Utricularia resupinata</i>	Inverted Bladderwort				2- May Be At Risk	Digby Neck. Barren lake in Richmond County, near Argyle (Yarmouth County).	Ponds, lakes and river shores.	Unlikely	NO
<i>Vaccinium boreale</i>	Northern Blueberry				2- May Be At Risk	Cape Breton, and 2 records on the mainland.	Exposed headlands and barrens.	Possibly	YES
<i>Vaccinium caespitosum</i>	Dwarf Bilberry				3- Sensitive	Black River, Gaspereau Valley, Kings County. Northern Victoria and Inverness counties. Halifax County.	Rocky cliffs and crevices. Dry or wet acidic sites from sea level to 3800 m.	YES	YES
<i>Vaccinium ovalifolium</i>	Oval-leaved Bilberry				2- May Be At Risk	North Cape Breton Island	Moist coniferous woods to an elevation of 2100 m.	YES	YES
<i>Vaccinium uliginosum</i>	Alpine Bilberry				3- Sensitive	Northern and eastern Cape Breton. Halifax and Digby counties.	Dry or wet, organic or inorganic acid soils. Tolerant of high copper concentrations.	YES	YES

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Vallisneria americana</i>	Wild Celery (Tape grass)				2- May Be At Risk	Locally abundant in marginal waters; Shorts Lake Brookfield Colchester County. Also reported in several different locations from Musquodoboit River in Halifax County to Northern Cape Breton.	Quiet waters	YES	NO
<i>Viburnum edule</i>	Squashberry				3- Sensitive	Northern Cape Breton.	Cold woods and along streams. Climax coniferous forest	NO	NO
<i>Viola nephrophylla</i>	Northern Bog Violet				3- Sensitive	Wet woods north of Truro. Occasionally in Cape Breton. Also is Wolfville and Shelburne County.	Cool mossy bogs. Borders of streams, and damp woods.	YES	Infrequent
<i>Woodsia alpina</i>	Alpine Cliff Fern				2- May Be At Risk	North Aspy River, Cape Breton. Cheticamp River and Big Southwest Brook, Inverness County; Indian Brook, Victoria County.	Dryish cliffs	NO	NO
<i>Woodsia glabella</i>	Smooth Cliff Fern				3- Sensitive	Jeffers Brook, Cumberland County. Big Southwest Brook, Lockhart Brook, and Skye Glen Mountain, northern Cape Breton.	Shaded vertical cliffs. Along streams in northern Cape Breton.	NO	NO
<i>Woodwardia areolata</i>	Netted Chain Fern				3- Sensitive	Yarmouth and Shelburne counties. A stream at Argyle Head, Yarmouth County.	Swamps, bog margins, and particularly along streams.	NO	NO
<i>Zizia aurea</i>	Golden Alexanders				2- May Be At Risk	Pomquet River and South River, Antigonish County. Upper Musquodoboit, Halifax County. Truro area and northeast.	Meadows, shores, damp thickets, and wet woods. Roadsides.	YES	NO
LICHENS									
<i>Anaptychia crinalis</i>	Hanging Fringed Lichen			Special Concern- 1994	3- Vulnerable	Europe, Asia, North America, Arctic.	On bark, cork, plant surfaces trunks, branches, twigs, also rock	YES	YES
<i>Anzia colpodes</i>	Black-foam Lichen				3- Vulnerable	Endemic to eastern NA as far north as NB and NS but avoids the SE coastal plain	Corticolous	YES	Infrequent
<i>Cavernularia hultenii</i>	Powdered Honeycomb Lichen				2- May be at Risk	Eastern and Western NA, also Europe	Wet forested coasts, true oceanic	YES	YES
<i>Gladonia coccifera</i>	Eastern Boreal Pixie-cup Lichen				3- Vulnerable	Circumpolar arctic and boreal	On soil and rotting logs and over rocks	Yes	YES
<i>Gladonia pocillum</i>	Rosette Pixie-cup Lichen				3- Vulnerable	Colchester, Victoria couotnies	On highly calcareous soils	Possibly	NO
<i>Gladonia stygia</i>	Black-footed Reindeer Lichen				3- Vulnerable		Characteristic of northern bogs, but also found in drier areas in boreal and Arctic regions of the Northern Hemisphere	YES	YES
<i>Collema furfuraceum</i>	Blistered Tarpaper Lichen				3- Vulnerable	Broad global range	Usually on bark but sometimes on rock	YES	YES
<i>Collema leptaleum</i>	Crumpled Bat's Wing Lichen				3- Vulnerable	Broad global range	On bark, especially on hardwoods	YES	YES
<i>Collema nigrescens</i>	Blistered Tarpaper Lichen				3- Vulnerable	Throughout NS	Corticolous, on base of poplar and other trees.	YES	YES
<i>Degelia plumbea</i>	Blue Felt Lichen	Special Concern-No schedule	Vulnerable -2013	Special Concern- 2010	4-Secure	Very rare in North America, but widespread in NS	Corticolous; moss covered trees and rocks. Prefers hardwoods	YES	Infrequent
<i>Ephebe lanata</i>	Waterside Rockshag Lichen				3- Vulnerable		On wet, siliceous rocks on lake and stream shores or dripping rock walls. Sometimes submerged	YES	Minimal

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region? <i>Erioderma mollissimum</i>	Vole Ears Lichen, Graceful Felt Lichen	Endangered- Schedule 1	Endangered-2013	Endangered- 2009	2- May be at Risk	Found throughout NS, in lichen rich locations.	Cool, maritime climates. Highly sensitive to acid rain. Grow on bark of coniferous trees. Corticolous	YES	Possible
<i>Erioderma pedicellatum</i>	Boreal Felt Lichen	Endangered- Schedule 1 (Atlantic Population)	Endangered-2003	Endangered- 2002	1- At Risk	Found in Maritime climates throughout NS, NB and NL. A 90 % reduction in NS and NB populations in the past 2 decades; in lichen rich regions	Cool, Maritime climates. Highly sensitive to acid rain. Grow on bark of coniferous trees	YES	Infrequent
<i>Evernia prunastri</i>	Valley Oakmoss Lichen				3- Vulnerable	Incompletely circumpolar	On bark, lignum, and occasionally rocks	YES	YES
<i>Everniastrum catawbiense</i>	Powder-tipped Antler Lichen				2- May be at Risk	NE North America	On conifer branches, and wood, mainly at high elevations	YES	NO
<i>Fuscopannaria leucosticta</i>	Rimmed Shingles Lichen				2- May be at Risk	Throughout NS	Corticolous, occasional on rocks, often among mosses.	YES	YES / Infrequent
<i>Fuscopannaria praetermissa</i>	Moss Shingles Lichen				2- May be at Risk	Circumpolar arctic and sometimes boreal, extending south in mountains. Hants and Inverness counties.	On moss over calcareous rocks or soil	Possibly	NO
<i>Heterodermia squamulosa</i>	Scaly Fringe Lichen				3- Vulnerable	Endemic to eastern NA	On trees, especially mossy tree bases, in hardwood forests	YES	Minimal
<i>Leptogium corticola</i>	Blistered Jellyskin Lichen				3- Vulnerable	Throughout NS	Corticolous; hardwoods, occasionally on White Cedar in the North; sometimes on mossy rocks.	YES	YES
<i>Leptogium lichenoides</i>	Tattered Jellyskin Lichen				2- May be at Risk	Arctic, boreal, and temperate NA and Europe	On calcareous rocks among mosses	YES	no
<i>Leptogium milligranum</i>	Stretched Jellyskin Lichen				3- Vulnerable	Temperate NA, Central and South America	Corticolous, especially on oaks. In NS only found on Red Maple.	YES	YES
<i>Leptogium subtile</i>	Appressed Jellyskin Lichen				3- Vulnerable	Throughout NS	In NS muscicolous, on trees, generally bases of trees.	YES	YES
<i>Leptogium teretiussculum</i>	Beaded Jellyskin Lichen				3- Vulnerable	Boreal NA and Europe	On trees	YES	YES
<i>Nephroma arcticum</i>	Arctic Kidney Lichen				2- May be at Risk	Circumpolar arctic to boreal	Ground, usually among mosses	YES	YES
<i>Nephroma bellum</i>	Naked Kidney Lichen				3- Vulnerable	Boreal to temperate in Northern Hemisphere, also in Africa	On mossy tree trunks and rocks	YES	YES
<i>Nephroma resupinatum</i>	Pimpled Kidney Lichen				2- May be at Risk	Circumpolar boreal	On rocks and tree trunks	YES	YES
<i>Pannaria lurida</i>	Veined Shingle Lichen				2- May be at Risk	Throughout NS, rare	Corticolous or mossy rocks	YES	YES
<i>Parmeliella parvula</i>	Hairless-spined Shield Lichen				2- May be at Risk	Europe, NA.	Prefers moist sheltered mossy woodlands with broad leaved trees, often near streams. Sometimes occurs on coniferous trees but rarely on rocks or timber.	YES	Infrequent
<i>Parmelinopsis minarum</i>	Tree Pelt Lichen				3- Vulnerable	Pan-temperate and montane pan-tropical, reported form NS	ON bark or rock	YES	YES

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region? <i>Parmeliopsis ambigua</i>	Slender Rosette Lichen				3- Vulnerable	Arctic, boreal, and western NA, Europe, Asia and Australia	Usually on conifer bark and lignum, rarely rocks	YES	NO
<i>Peltigera collina</i>	Bottlebrush Frost Lichen				3- Vulnerable	Eastern and Western NA	On soil, generally in woodlands, fields or sand areas, less commonly on tree bases or mossy rocks	YES	YES
<i>Peltigera hydrothyria</i>	Eyed Mossthorns Woollybear Lichen				2- May be at Risk		Aquatic...	YES	Infrequent
<i>Physcia subtilis</i>	Appalachian Speckleback Lichen				3- Vulnerable	Endemic to temperate NA	On rocks	YES	YES
<i>Physconia detersa</i>	Angelhair Ramalina Lichen				3- Vulnerable	Boreal and northern temperate NA, Europe, and Asia	Mostly on trees, also rocks	YES	YES
<i>Polychidium muscicola</i>	Peppered Moon Lichen				2- May be at Risk	Arctic, boreal, and northern temperate areas. Throughout NS.	Among mosses on exposed or shaded rocks. ON moist arctic ?????? Or occasionally on ground or at base if trees	YES	YES
<i>Punctelia appalachensis</i>	Powdered Moon Lichen				3- Vulnerable	Endemic to eastern North America, mostly in Appalachian region	On deciduous trees	YES	YES
<i>Ramalina thrausta</i>	Petaled Rocktripe Lichen				3- Vulnerable	Circumpolar	On trees, rarely rocks	YES	YES
<i>Sticta fuliginosa</i>	Warty Beard Lichen				3- Vulnerable	Oceanic sites in NS, Europe, SA, Africa, Australia and NZ	Mossy bark, rarely mossy rock	YES	YES
<i>Sticta limbata</i>	Coastal Bushy Beard Lichen				2- May be at Risk		Mossy bark and rock, especially in coastal forest	YES	YES
<i>Umbilicaria polyphylla</i>	Blood-splattered Beard Lichen				3- Vulnerable	NA, SA, Europe, south Africa, Asia, Australia, and NZ. Cape Breton, Victoria, Kings and Cumberland counties	On nutrient -encrusted siliceous rocks	Possibly	YES
<i>Usnea ceratina</i>	Straw Beard Lichen				3- Vulnerable	Eurasia, NA, and SA	Usually on trees, occasionally rocks, near moist lakesides, wetlands or coastal habitats	YES	YES
<i>Usnea flammea</i>	Coastal Bushy Beard Lichen				3- Vulnerable	Oceanic sites of western Europe and ne NA,	On trees and rocks	YES	YES
<i>Usnea flavocardia</i>	Blood-splattered Beard Lichen				3- Vulnerable	Rare in oceanic area of Europe, NS, and south SA	On trees, usually in coastal areas	YES	YES
<i>Usnea mutabilis</i>	Bloody Beard Lichen				3- Vulnerable	Eastern and eastern NA, sw Europe, Japan, especially common in se NA	On trees in deciduous and pine forests.	YES	Infrequent
<i>Usnea scabrata</i>	Straw Beard Lichen				3- Vulnerable	Circumpolar boreal to montane N Hemisphere	On conifers in forests or open habitat	YES	YES
<i>Usnea substerilis</i>	Embossed Beard Lichen				2- May be at Risk	Circumpolar boreal and temperate	On trees	YES	YES
<i>Usnocetraria oakesiana</i> (syn. <i>Cetraria/Allocetraria oakesiana</i>)	Yellow Band Lichen				2- May be at Risk	Endemic to the Great Lakes/Appalachian regions. Annapolis, Colchester, Cumberland and Hants counties	On both conifers and some hardwoods, occasionally on rocks	YES	YES
BIRDS									

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Actitis macularius</i>	Spotted Sandpiper				3- Sensitive		Breeds near water in a variety of habitats, including shorelines, grasslands and forests. Found in both coastal and freshwater habitats during migration.	YES	YES
<i>Alca torda</i>	Razorbill			Special Concern 2008	3- Sensitive	Margaree Island and eastern Cape Breton (including Bird Islands and Scatarie Island); southern NS.	Breeds on inaccessible coastal islands and cliffs. Nesting: typically in crevices on rocky cliffs.	YES	Unlikely
<i>Anas acuta</i>	Northern Pintail				2- May Be At Risk		Open fertile marsh including estuary	YES	Unlikely
<i>Anas clypeata</i>	Northern Shoveler				2- May Be At Risk		Shallow marshes with lots of cover, wetlands, ponds, sloughs, lakes with abundant vegetation	YES	NO
<i>Anas discors</i>	Blue-winged Teal	Threatened-- Schedule 1		Special Concern (2011)	2- May Be At Risk		Shallow, freshwater marshes, wetlands, ponds, prairie sloughs, lakes with vegetation and slow-flowing muddy creeks	YES	NO
<i>Anas strepera</i>	Gadwall	Special Concern-- Schedule 1		Endangered-2007	2- May Be At Risk		Freshwater marshes, ponds, shallow lakes	YES	NO
<i>Anthus (syn. Caprimulgus) vociferus</i>	Eastern Whip-poor-will	Threatened- Schedule 1	Threatened-2007	Threatened-April 2009	1- At Risk 1	Possible breeding records in southern Nova Scotia	Dry deciduous or mixed forests with little or no underbrush; requires shade and proximity to open areas for foraging. Nesting: Eggs laid on leaf litter, usually partially shaded by vegetative cover.	Unlikely	Unlikely
<i>Asio flammeus</i>	Short-eared Owl	Special Concern- Schedule 1		Special Concern - 2008	2- May Be At Risk	Found in middle America, Europe, Asia and Africa. Breeds in every province and territory in Canada. Sparsely scattered throughout coastal NS; most near Amherst and Bay of Fundy.	Usually found in open country supporting cyclic small mammals (voles, lemmings), large expanses of grasslands, heathlands, shrub-steppe, tundra or agricultural areas. Nesting: dry sites with enough vegetation to conceal incubating female.	YES	Yes
<i>Asio otus</i>	Long-eared Owl			Threatened	2- May Be At Risk		Open forests and areas of dense vegetation adjacent to open grassland or shrubland.	YES	Unlikely
<i>Botaurus lentiginosus</i>	American Bittern	Threatened- Schedule 1		Threatened	3- Sensitive		Freshwater marshes, wetlands	YES	NO
<i>Branta bernicla</i>	Brant			Threatened_ Reassessed Nov 2009	3- Sensitive	Does not nest in NS. Winter feeding grounds: Northumberland Strait, Cape Sable (late winter), Brier Island, Wallace Harbour in Cumberland county and Minas Basin.	Found in NS during the winter months, mostly in marine habitats	YES	Unlikely
<i>Bucephala islandica</i>	Barrow's Goldeneye	Special Concern-No Schedule		Special Concern (2011)	1- At Risk 1	Small numbers breed and winter in Maritimes. During non-breeding season, species found in coastal waters of Estuary and Gulf. During late fall, winter and early spring, large numbers are found in a few areas of St. Lawrence corridor.	Breeding appear to be restricted to high elevation lakes north of St. Lawrence Estuary and Gulf. Eastern Canada populations have dwindled in recent years as a result of habitat loss due to fish introduction, logging and contamination.	YES	YES
<i>Calidris canutus</i>	Red Knot		Endangered (2007)		1- At Risk 1	Does not breed in NS; found on mud beaches and flats during fall migration.	Sand beaches adjacent to mud flats, typically near estuaries, bays and inlets.	YES	Unlikely
<i>Calidris canutus rufa</i>	Red Knot rufa subspecies	Endangered- Schedule 1	Endangered 2007	Endangered-2007	1- At Risk 1	Does not breed in NS; found on mud beaches and flats during fall migration.	Sand beaches adjacent to mud flats, typically near estuaries, bays and inlets.	YES	Unlikely
<i>Calidris maritima</i>	Purple Sandpiper				3- Sensitive	Rocky shores on the Atlantic and Fundy coasts, Minas Basin.	Coastal environments.	YES	YES
<i>Calidris pusilla</i>	Semipalmated Sandpiper				3- Sensitive		Breeds in subarctic tundra; found in coastal habitats during migration.	YES	YES

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Cardellina (syn. Wilsonia) canadensis</i>	Canada Warbler	Endangered- Schedule 1	Endangered	Threatened	1- At Risk 1	Throughout NS.	Most abundant in moist, mixed forests with a well-developed understorey, dense nest site cover. Often near open water. Nesting: Typically on or near the ground, often on slopes, knolls, in earthen banks, or rocky areas.	YES	Possible
<i>Cathartes aura</i>	Turkey Vulture				3- Sensitive		Preferred habitat includes farmland with pasture and abundant carrion close to undisturbed forested areas for perching, roosting, and nesting. This species nests in dark recesses beneath boulders, on cliff ledges, in hollow trees, logs, and stumps, and in abandoned buildings	YES	Possible
<i>Gatharus bicknelli</i>	Bicknell's Thrush	Threatened- Schedule 1	Endangered-2013	Threatened (2009)	1- At Risk 1	Primarily breed in Quebec, but some populations breed in New Brunswick and Cape Breton Highlands.	Breed at high elevation, dense and stunted fir/spruce forests (726 m to 914 m a.s.l.) on rocky peaks. Favour a wet, cool, windy climate that increases in severity with elevation. Nesting: usually in dense fir stands, against tree trunk.	YES	Unlikely
<i>Chaetura pelagica</i>	Chimney Swift	Threatened- Schedule 1- Schedule 1	Endangered -2007	Threatened- 2007	1- At Risk 1	Scattered records throughout NS. Large colony in Wolfville.	More concentrated in urban areas where there are large concentrations of chimneys for nest sites and communal roosts. Nesting: primarily chimneys and other artificial sites; occasionally uses hollow trees.	Possible	Unlikely
<i>Charadrius melodus melodus</i>	Piping Plover melodus subspecies	Endangered- Schedule 1	Endangered -2000	Endangered - November 2013 (No Change)	1- At Risk 1	Coastal habitats; mainly in southwestern and southern NS, but some records from Cape Breton Island and Antigonish County.	Sand and gravel beaches. Nesting: on the ground, above normal high water mark.	YES	Unlikely
<i>Charadrius vociferus</i>	Killdeer	Threatened- Schedule 1-		Threatened 2010	3- Sensitive		A variety of open habitats, including sandbars, mudflats, heavily grazed pastures, cultivated fields, athletic fields, airports, golf courses, graveled lots, and graveled rooftops	YES	Possible
<i>Chlidonias niger</i>	Black Tern	Special Concern-- No schedule		Not at Risk- April 1996	2- May Be At Risk		Shallow freshwater marshlands.	Unlikely	NO
<i>Chordeiles minor</i>	Common Nighthawk	Threatened- Schedule 1	Threatened 2007	Threatened- April 2007 (new)	1- At Risk 1	Scattered throughout NS, with emphasis to the eastern side as well as Cape Breton.	Coastal sand dunes and beaches, logged or slashburned areas of forest sites, woodland clearings, grassland habitat, farm fields, open forests, rock outcrops, and flat gravel rooftops. Nesting: Nests in open areas on the ground.	YES	YES
<i>Coccyzus erythrophthalmus</i>	Black-billed Cuckoo				2- May Be At Risk		Coniferous and deciduous woodlands, deserts, open country, along coast, and urban areas	YES	Unlikely
<i>Contopus cooperi</i>	Olive-sided Flycatcher	Threatened- Schedule 1	Threatened 2013	Threatened- November 2007 (New)	1- At Risk 1	Throughout NS	Along forest edges and openings with tall snags for foraging and singing. Nesting: generally well out toward tip of horizontal branch in coniferous tree.	YES	YES
<i>Contopus virens</i>	Eastern Wood Peewee	Special Concern-- No schedule	Vulnerable -2013	Special Concern- Nov 2012 (new)	3- Sensitive	Throughout NS.	Damp boreal forests, spruce bogs, swamps, coniferous forests, wet areas with sphagnum-moss ground cover	YES	YES
<i>Dendroica castanea</i>	Bay-breasted Warbler				3- Sensitive		Spruce-fir forests	YES	YES
<i>Dendroica striata</i>	Blackpoll Warbler				3- Sensitive		Deciduous and mixed forests, damp woodlands	YES	YES
<i>Dendroica tigrina</i>	Cape May Warbler				3- Sensitive		Mixed and deciduous forests with thick undergrowth, rhododendron thickets, beech and maple forests	YES	Possible

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Dolichonyx oryzivorus</i>	Bobolink	Threatened-No schedule	Vulnerable	Threatened-April 2010	3- Sensitive	Throughout NS, especially farming areas	Grasslands and pastures; agricultural fields. Nesting: on ground, beneath vegetation.	YES	Unlikely
<i>Dumetella carolinensis</i>	Gray Catbird				2- May Be At Risk		Open woodlands, suburban areas, thickets	YES	Possible
<i>Empidonax flaviventris</i>	Yellow-bellied Flycatcher				3- Sensitive		Birch forests, bogs, edges of marshes, damp thickets of alder or willows	YES	YES
<i>Empidonax traillii</i>	Willow Flycatcher				3- Sensitive		Breeds in a variety of usually shrubby, often wet habitats	YES	Unlikely
<i>Euphagus carolinus</i>	Rusty Blackbird	Special Concern-- Schedule 1	Endangered 2013	Special Concern- April 2006 (new)	2- May Be At Risk	Uncommon, but present throughout NS.	Frequent cool habitats in forest openings, including spruce bogs, swamps, and damp alder swales. Nesting: In trees and shrubs, 0.5 m to 6 m above ground or over water.	YES	YES
<i>Falco peregrinus anatum/tundrius</i>	Peregrine Falcon anatum/tundrius	Special Concern-- Schedule 1	Vulnerable (2007)	Special Concern- April 2007 (Reassigned)	3- Sensitive	The <i>anatum</i> subspecies is scattered sparsely through mainland NS, primarily around Bay of Fundy. (The <i>tundrius</i> ssp.: is not found in NS).	Wide variety of habitats, with suitable cliffs or platforms for nest. Nesting: on cliff ledges or platforms ranging from about 8 to 400 m high; cliffs 50–200 m preferred.	YES	Unlikely
<i>Fratercula arctica</i>	Atlantic Puffin				3- Sensitive	Machais Seal Island, NB; scattered islands on the south shore of NS (e.g. Pearl Island); and Bird Islands in Cape Breton.	Breeding colonies on islands that permit excavation of nesting burrows, also rocky seacoasts. Nesting: burrows; occasionally cliff crevices.	Unlikely	Unlikely
<i>Gallinago delicata</i> (form. <i>G. gallinago</i>)	Wilson's Snipe				3- Sensitive		Sedge bogs, fens, alder or willow swamps, and pond and river edges.	YES	YES
<i>Gavia immer</i>	Common Loon	Special Concern-- Schedule 1		Not at Risk - April 1997	2- May Be At Risk	Throughout NS	Prefers lakes larger than 24 ha with clear water, an abundance of small fish, numerous small islands, and an irregular shoreline. Nesting: ground-nesting; prefers to nest on islands.	YES	YES
<i>Hirundo rustica</i>	Barn Swallow	Threatened-No schedule	Endangered-2013	Threatened-May 2011 (New)	3- Sensitive	Throughout NS, especially farming areas	Open areas (fields, meadows) for foraging. Nesting: Mud nest fastened to a vertical wall or ledge underneath an overhang.	YES	Unlikely
<i>Histrionicus histrionicus</i>	Harlequin Duck	Special Concern- Schedule 1	Endangered 2000	Special Concern- November 2013 (No Change)	1- At Risk 1	Two probable nesting records, one in western Cape Breton and another in southwestern NS. Winter in east and south coasts of NL, southern NS, NB, Maine and Cape Cod.	Nests built on ground on islands or banks of fast-flowing streams. Favour marine environments, but move inland to breed. In winter, occurs along headlands where surf breaks against rocks. Feed close to rocky shorelines or skerries.	YES	YES
<i>Hylocichla mustelina</i>	Wood Thrush	Threatened-No schedule		Threatened- November 2012	5- Undetermined		Moist woodlands, swamps, forest edges	Unlikely	Unlikely
<i>Icterus galbula</i>	Baltimore Oriole				2- May Be At Risk		Open coniferous forests or mixed woodlands	YES	Unlikely
<i>Ixobrychus exilis</i>	Least Bittern	Threatened- Schedule 1		Threatened April 2009 (No Change)	5- Undetermined	Not known to nest in NS.	Tall emergent vegetation in marshes, primarily freshwater, less commonly in coastal brackish marshes	Unlikely	Unlikely
<i>Limosa haemastica</i>	Hudsonian Godwit				3- Sensitive		During migration, found in inland and coastal wetlands, including estuaries, mudflats, salt marshes, sandy shores, lakes, fresh-water marshes. Roost sites include salt marshes, sand spits, small islands. Nests on coastal arctic tundra.	Possible	Unlikely
<i>Myiarchus crinitus</i>	Great Crested Flycatcher				2- May Be At Risk		Open woodlands, clearings	Unlikely	Unlikely

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Numenius borealis</i>	Eskimo Curlew	Endangered- Schedule 1		Endangered- November 2009 (No Change)	5- Undetermined	Possibly extinct. Does not breed in NS; historically, flew east to Maritimes during migration, using a variety of coastal and open terrestrial habitats.	Tundra to transitional woodland in arctic regions of Canada.	Unlikely	NO
<i>Numenius phaeopus</i>	Whimbrel				3- Sensitive		Arctic tundra, bogs, marshes at edge of boreal forests	YES	Possible
<i>Nycticorax nycticorax</i>	Black-crowned Night-Heron				2- May Be At Risk	Southwestern NS, and historically near Amherst	Wide variety of wetland habitats; essentials seem to be good cover, and freshwater, saltwater, or brackish foraging area. Nesting: colonially, in trees; usually on islands, in swamps, or over water	Unlikely	NO
<i>Passerculus sandwichensis ssp. princeps</i>	Savannah Sparrow (Ipswich ssp.)	Special Concern-- Schedule 1		Special Concern - November 2009	1- At Risk 1	Ipswich Sparrows nest almost exclusively on Sable Island. Some nest on beaches in southern NS, and occasionally winter elsewhere in the province.	Found in heath-dominated terrain in dense marram grass on coastal dunes and upper beaches; prefer outer dune beaches with good grass coverage. Nesting: Nests of grass and vegetation built on hollows scratched in ground under shelter of shrub, small tree or tussock of grass.	Unlikely	Unlikely
<i>Perisoreus canadensis</i>	Canada Jay				3- Sensitive	Scattered throughout NS.	Favours coniferous or mixed-coniferous forests. Nesting: in trees, generally near edge of small forest openings (bogs, trails).	YES	YES
<i>Petrochelidon pyrrhonota</i>	Cliff Swallow				2- May Be At Risk		Nests in often large colonies, under rock ledges, highway culverts, bridges, and buildings	YES	NO
<i>Phalacrocorax carbo</i>	Great Cormorant				3- Sensitive		Rocky islands, cliffs facing water, stands of trees near water	YES	Possible
<i>Phalaropus fulicarius</i>	Red Phalarope				3- Sensitive		Pelagic outside the breeding season. Nests on low, swampy arctic tundra	YES	NO
<i>Phalaropus lobatus</i>	Red-necked Phalarope				3- Sensitive		Pelagic outside the breeding season. Nests on arctic tundra	YES	NO
<i>Pheucticus ludovicianus</i>	Rose-breasted Grosbeak				3- Sensitive		Woodland edges, weedy fields, thickets	YES	YES
<i>Picoides arcticus</i>	Black-backed Woodpecker				3- Sensitive		Open woodlands, mature forests	YES	YES
<i>Pinicola enucleator</i>	Pine Grosbeak				2- May Be At Risk		Open woodlands, conifer forests	YES	YES
<i>Pluvialis dominica</i>	American Golden-Plover				3- Sensitive		During migration, found in a variety of open inland and coastal habitats, both natural and human-made. Nests on muskeg to edge of tundra, grassy marshes.	Possible	Unlikely
<i>Podilymbus podiceps</i>	Pied-billed Grebe				3- Sensitive		Breeds in freshwater marshes, lakes, and slow-moving rivers.	YES	NO
<i>Poecile hudsonicus</i>	Boreal Chickadee				3- Sensitive	Throughout NS.	Boreal forests	YES	YES
<i>Pooecetes gramineus</i>	Vesper Sparrow				2- May Be At Risk	Northern mainland Nova Scotia, Cape Breton Highlands.	Breeds in dry, open habitats with short, sparse, and patchy herbaceous vegetation; some bare ground; and low to moderate shrub or tall forb cover. Found in a wide variety of grassland habitats. Nesting: Nests on ground, usually near vegetative cover.	Possible	Unlikely

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Progne subis</i>	Purple Martin				2- May Be At Risk	Scattered breeding records in Amherst, Guysborough Co., northern Bay of Fundy	Found almost exclusively near human settlement, even in highly urban areas. Nesting: in tree cavities or (more commonly) in birdhouses.	Unlikely	Unlikely
<i>Regulus calendula</i>	Ruby-crowned Kinglet				3- Sensitive	Throughout NS.	Coniferous and mixed forests.	YES	YES
<i>Regulus satrapa</i>	Golden-crowned Kinglet				3- Sensitive	Throughout NS.	Coniferous forests during breeding season; in winter, may be found in coniferous, mixed and deciduous forests.	YES	YES
<i>Riparia riparia</i>	Bank Swallow			Threatened	2- May Be At Risk	Throughout NS.	Along rivers, streams, lakes, and coasts. Nesting: burrows in banks, cliffs and bluffs; may also use artificial sites such as sand and gravel quarries and road cuts.	YES	NO
<i>Rissa tridactyla</i>	Black-legged Kittiwake				3- Sensitive		Inaccessible coastal cliffs and offshore islands. Largely pelagic outside of breeding season.	YES	NO
<i>Sayornis phoebe</i>	Eastern Phoebe				3- Sensitive		Open deciduous and coniferous woodlands	YES	YES
<i>Sialia sialis</i>	Eastern Bluebird			Not at Risk- April 1996	3- Sensitive	Throughout NS.	Prefers open habitat with little or no understory, such as orchards and clear cut areas amid forests. Nesting: In nest boxes or abandoned nest cavities; prefers nesting in dead trees.	Possible	Unlikely
<i>Spinus pinus</i>	Pine Siskin				3- Sensitive	Throughout NS.	Generally inhabits coniferous or mixed coniferous-deciduous forests	YES	YES
<i>Sterna dougallii</i>	Roseate Tern	Endangered-- Schedule 1	Endangered 2000	EndangeredApril 2009 (No Change)	1- At Risk	Colonies sparsely scattered on southern shore of NS (Brothers Islands, Grassy Island, and Country Island Complex)	Colonies on rocky offshore islands, barrier beaches, or salt marsh islands, usually close to shallow-water fishing sites with sandy bottoms, bars, or shoals. Nesting: Typically use dense vegetation, rocks, or other shelter and hide their nests, but occasionally nest in open. Readily use inverted boxes or half-buried tires, which provide covered nest sites.	YES	Possible
<i>Sterna hirundo</i>	Common Tern			Not at Risk- April 1998	3- Sensitive	Throughout NS, particularly the southern coast and Cape Breton.	Usually nests on islands, sometimes on barrier beaches or promontories attached to mainland, or salt marshes; occasionally freshwater marshes. Nesting: on ground, primarily in open areas with loose substrate, with scattered vegetation or other cover	YES	YES
<i>Sterna paradisaea</i>	Arctic Tern				2- May Be At Risk	Lower Bay of Fundy, south shore of mainland NS, south and east shores of Cape Breton Island	Generally nests close to water, frequently on small rocky, gravelly, grassy, or peaty islands; also barrier beaches and sand or gravel spits, gravel bars in rivers, or glacial moraines, as well as marshes, bogs, and grassy meadows. For feeding, uses streams, ponds, lakes, estuaries, and inshore waters. Nesting: On ground or low vegetation in open areas.	YES	YES
<i>Sturnella magna</i>	Eastern Meadowlark	No Status-No Schedule		Threatened- May 2011	3- Sensitive	Throughout NS	Grassland habitats	Possible	Possible
<i>Tachycineta bicolor</i>	Tree Swallow				3- Sensitive		Open fields, meadows, marshes. Nesting: Typically in standing dead trees, or nest boxes where available.	YES	YES
<i>Tringa melanoleuca</i>	Greater Yellowlegs				3- Sensitive		Breeds in muskeg, wet bogs with small wooded islands, and forests (usually coniferous) with abundant clearings. During migration, uses a variety of coastal habitats and wetlands.	YES	Yes

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Tringa semipalmata</i>	Willet				2- May Be At Risk	Occurs throughout	Breeds most commonly on salt marshes, barrier islands, and barrier beaches; also pastures and farmlands in Nova Scotia	YES	Yes
<i>Tyrannus tyrannus</i>	Eastern Kingbird				3- Sensitive		Open habitats, frequently along woodland edges.	YES	Yes
<i>Vermivora peregrina</i>	Tennessee Warbler				3- Sensitive		Open woodlands, brushy areas, cut-over and burned woods, second-growth woodlands, edges of bogs	YES	Yes
<i>Wilsonia pusilla</i>	Wilson's Warbler				3- Sensitive		Undergrowth in moist mature forests, dense woodlands near streams or swamps	YES	YES
HERPETILES (TERRESTRIAL)									
<i>Chelydra serpentina</i>	Common Snapping Turtle	Special Concern- Schedule 1	Vulnerable -2013	Special Concern- November 2008 (New)	4 - Secure	Mainland NS	All types of freshwater habitats, especially those with soft mud bottom and abundant aquatic vegetation or submerged brush and logs. In brackish water in some areas. Mostly a bottom dweller. Hibernates singly or in groups in streams, lakes, ponds, or marshes	YES	YES
<i>Emydoidea blandingii</i>	Blandings' Turtle- NS population	Endangered- Schedule 1		Endangered-May 2005 (In a higher risk category)	1- At Risk 1		Forested wetlands in southern NS	NO	NO
<i>Glyptemys insculpta</i>	Wood Turtle	Threatened- Schedule 1	Threatened -2000	Threatened- November 2007 (In a higher risk category)	3- Sensitive	The species has been reported in most of New Brunswick, north-central Nova Scotia (including Cape Breton Island), southern Quebec, and both south-central and north-central Ontario.	The species is associated with moving water; it frequents streams, creeks and rivers. It is also one of the most terrestrial members of its family and occupies a great variety of habitats, including forests, but favours riparian areas with open canopy.	YES	YES
<i>Thamnophis sauritus septentrionalis</i>	Northern Ribbon Snake (Eastern Ribbonsnake.)	Threatened- Schedule 1	Threatened 2003	Threatened November 2012 (No Change)	1- At Risk 1	Southwestern, Nova Scotia - Queens County and Lunenburg County.	Quiet, Vegetated ponds, coves of lakes and grassy places along streams. Enjoy an abundance of aquatic vegetation.	NO	NO
ODONATES									
<i>Coenagrion resolutum</i>	Taiga Bluet				2- May Be At Risk	Known to occur in Guysborough County	Found at sedge marshes and fens and well-vegetated pond and lake edges, at large lakes in sedge beds. Often in stands of water horsetail <i>Equisetum hiemale</i> .	YES	Yes
<i>Enallagma signatum</i>	Orange Bluet				2- May Be At Risk		Lentic habitat, including ponds and lakes. Flight period: late June to early September.	YES	yes
<i>Enallagma vesperum</i>	Vesper Bluet				3- Sensitive		Lentic habitat; found in small lakes with lots of floating vegetation and occasionally slow-moving streams.. Flight period: early July to mid August.	YES	Yes
<i>Epitheca princeps</i>	Prince Baskettail				3- Sensitive		Rivers, Streams and Lakes. Only active wave-washed shores of lakes, and slow running streams and rivers.	YES	Unlikely
<i>Erythrodiplox berenice</i>	Seaside Dragonlet				3- Sensitive	Known to occur in Guysborough County	Salt-marsh habitats	YES	No
<i>Gomphaeschna furcillata</i>	Harlequin Damer				3- Sensitive	Known to occur in Guysborough County	Swamps or bogs	YES	YEs
<i>Gomphus desertus</i>	Harpoon Clubtail				3- Sensitive		Live in streams in particularly open forest.	YES	Possible

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Gomphus ventricosus</i>	Skillet Clubtail				2- May Be At Risk		Breed in deep rivers where they can burrow into mud in deep pools.	YES	No
<i>Ophiogomphus aspersus</i>	Brook Snaketail				2- May Be At Risk	Known to occur in Guysborough County	Clear sand bottomed streams with intermittent rapids. Sand or gravel; Current may be slow to strong.	YES	No
<i>Ophiogomphus mainensis</i>	Maine Snaketail				2- May Be At Risk		This species is mainly associated with clear, rocky woodland streams and smaller rivers, frequently where they drain marshes or lakes.	YES	No
<i>Ophiogomphus rupinsulensis</i>	Rusty Snaketail				2- May Be At Risk	Known to occur in Guysborough County	Common along rivers. Inhabits generally low-flowing mesotrophic rivers with diverse substratum.	Unlikely	Unlikely
<i>Somatochlora albicincta</i>	Ringed Emerald				2- May Be At Risk		Near mountain lakes	No	No
<i>Somatochlora septentrionalis</i>	Muskeg Emerald				3- Sensitive	In Nova Scotia, confined to the Cape Breton Highlands	Shallow <i>Sphagnum</i> -choked ponds within bogs	No	No
<i>Somatochlora williamsoni</i>	Williamson's Emerald				2- May Be At Risk	Known to occur in Guysborough County	Occurs throughout southeastern Canada and northeastern United States, including the Appalachian Mountains, it is usually found at slow streams and lakes, and sometimes bog lakes. It seems to prefer shaded habitats.	YES	Possible
<i>Williamsonia fletcheri</i>	Ebony Boghaunter				2- May Be At Risk	Known to occur in Guysborough County	Lentic; Bogs and fens, also found sometimes water suspended/saturated sphagnum.	YES	Yes
BUTTERFLIES									
<i>Boloria chariclea</i>	Arctic Fritillary				3- Sensitive	Historic record from Parrsboro area; two MBA records, one in central Cape Breton and the other in northern NB.	Boreal forest clearings and along transmission lines and bogs. Host plants include willow (<i>Salix</i> spp.) and possibly violets (<i>Viola</i> spp.)	NO	NO
<i>Callophrys lanoraieensis</i>	Bog Elfin				2- May Be At Risk	Reported in New Brunswick and central Nova Scotia, Early May to late June.	Bogs, wood roads and sandy pine forests with black spruce. Host plant: Black spruce.	YES	YES
<i>Danaus plexippus</i>	Monarch	Special Concern- Schedule 1		Special Concern - April 2010 (No Change)	3- Sensitive	Several MBA records from all three provinces; none from eastern NS. The eastern population includes all Monarchs east of the Rocky Mountains, from the Gulf coast to southern Canada, and from the Great Plain States and Prairie Provinces east to the Atlantic coast.	Primarily found in places where milkweed (<i>Asclepius</i>) and wildflowers such as goldenrod, asters, and purple loosestrife exist. This includes abandoned farmland, along roadsides, and other open spaces.	YES	Yes
<i>Erora laeta</i>	Early Hairstreak				2- May Be At Risk	Recorded in the Wentworth Valley and Annapolis Valley. No Maritimes Butterfly Atlas (MBA) records to date.	Deciduous woods where beech is present. Larvae feed on beech nuts. Adults seldom leave forest canopy.	NO	NO
<i>Oeneis jutta</i>	Jutta Arctic				2- May Be At Risk	Known to occur in NB and northern Cape Breton. Thirteen MBA records to date for NB, and five for NS (Guysborough Co. and Cumberland Co.)	Typically observed around margins of bogs and fens. Host plants include a variety of sedges, such as <i>Carex</i> sp. and tussock cotton-grass.	YES	YES
<i>Papilio brevicauda</i>	Short-tailed Swallowtail				3- Sensitive	Only found in the Atlantic provinces and eastern Quebec. Single MBA record for NS in Victoria Co.; seven records for northern NB.	Coastal marshes, dunes and headlands in the presence of its primary larval foodplant, Scotch lovage. Rarely occurs inland, and infrequently uses other members of the carrot family.	NO	NO
<i>Pieris oleracea</i>	Mustard White				3- Sensitive	Widespread. Adults present early May to mid June, and mid July to late August. Two broods per year.	Along roadsides and in open spaces in forested areas. Host plant: Various members of the Mustard family, particularly rock cresses and toothworts.	YES	YES
<i>Polygonia gracilis</i>	Hoary Comma				3- Sensitive	Three MBA records, all in northern NB.	Often seen visiting flowers, typically goldenrod and pearly everlasting. Host plants include a variety of currants (<i>Ribes</i> spp.)	NO	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Polygonia satyrus</i>	Satyr Comma				3- Sensitive	Five MBA records, all from northern NB.	Woodlands, often found sitting on wood roads and trails. Attracted to animal droppings and carrion, as well as sap and fermented fruit. Host plant is the stinging nettle.	NO	NO
<i>Thorybes pylades</i>	Northern Cloudywing				3- Sensitive	Three historic records from Pictou and Colchester counties. Three MBA records for NS (Antigonish Co. and Guysborough Co.), and several for northern NB and Fredericton area.	Variety of open forest and meadow habitats, where it regularly visits flowers. Highly colonial and can be locally common. Host plants include vetch, beach pea and other legumes.	YES	YES
FISHES (FRESHWATER)									
<i>Acipenser oxyrinchus</i>	Atlantic Sturgeon	No Status-No schedule		Threatened-May 2011 (New)	2- May Be At Risk	New Brunswick, Nova Scotia, Atlantic Ocean-Located along the Fundy coast of NS, and in the northern tip of the Cape Breton Highlands. Adults may occur all around coast of NS	Important habitat for Atlantic Sturgeon is a river with access to the sea, preferably with deep channels; an estuary with relatively warm, partially saline water and a coastal shelf region. Atlantic Sturgeon spawn in freshwater over rocky-gravel substrates at a depth of 1 - 3 m in areas with a strong current, and also under waterfalls, and in deep pools.	YES	Possible (marine environment)
<i>Alosa pseudoharengus</i>	Alewife				3- Sensitive		Rivers, freshwater lakes, ponds and streams	YES	Unlikely
<i>Anguilla rostrata</i>	American Eel	No Status-No schedule		Threatened-May 2012 (In a higher risk category)	2- May Be At Risk		A variety of marine and freshwater habitats over the course of its life history.	YES	YES (marine environment)
<i>Coregonus huntsmani</i>	Atlantic Whitefish	Endangered- Schedule 1	Endangered	Endangered- Nov 2012	1- At Risk		Cool water streams and some natural lakes. Prefers streams with moderate currents over sand and gravel bottoms with clean to slightly turbid water.	NO	NO
<i>Culaea inconstans</i>	Brook Stickleback				3- Sensitive		Cool water streams and some natural lakes. Prefers streams with moderate currents over sand and gravel bottoms with clean to slightly turbid water.	YES	Unlikely
<i>Margariscus margarita</i>	Pearl Dace				3- Sensitive		Lakes, cool bog ponds, creeks, and cool springs	YES	Unlikely
<i>Morone saxatilis</i>	Striped Bass-Gulf of St. Lawrence population	Special Concern-No schedule		Special Concern- November 2012 (In a lower risk category)	1- At Risk (Atlantic) (2005)		Steady-flowing, turbid rivers that have low slopes and large estuaries, also marine	YES	NO
<i>Salmo salar</i>	Atlantic Salmon	Endangered-No schedule			2- May Be At Risk	Nova Scotia, Atlantic Ocean	Atlantic Salmon rivers are generally clear, cool and well oxygenated, with low to moderate gradient, and possessing bottom substrates of gravel, cobble and boulder.	YES	Possible (marine environment)
<i>Salvelinus fontinalis</i>	Brook Trout				3 -Sensitive (Atlantic, 2005)	Maritime provinces, Newfoundland and Labrador west to Manitoba	Cool clear waters of 10 - 18C with a lot of cover. Usually they live in spring-fed streams with many pools and riffles.	YES	Unlikely
FRESHWATER									
<i>Alasmodonta varicosa</i>	Brook Floater (Swollen Wedge Mussel)	Special Concern- Schedule 1	Threatened -2013	Special Concern- April 2009	3- Sensitive	From Nova Scotia and New Brunswick to North Carolina	Usually found in rapids or riffles on rocky or gravel substrates and in sandy shoals. Most abundant in small rivers and creeks.	YES	NO
<i>Lampsilis cariosa</i>	Yellow Lampmussel	Special Concern- Schedule 1	Threatened -2006	Special Concern- November 2013 (No Change)	2- May Be At Risk	From Sydney River, Cape Breton to Georgia.	Predominantly a river species. Occurs in swift currents on shoals or in riffles and principally on sand bottom. Occasionally found in ponds.	NO	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Lampsilis radiata</i>	Eastern Lampmussel				3- Sensitive	Throughout NS	Occupies a wide range of freshwater habitats, occurring in small to large river systems and lakes of various sizes. Prefers gravel or sand bottoms, occasionally found in silty or muddy bottoms	YES	NO
<i>Leptodea ochracea</i>	Tidewater Mucket				3- Sensitive	Atlantic coastal plain from Cape Breton to Savannah River, Georgia	Occurs in quiet water, that is ponds, canals, and slow moving parts of rivers. Found in mud or sand bottoms. Occurs only near the seacoast.	YES	NO
<i>Margaritifera margaritifera</i>	Esatern Pearlshell				3- Sensitive	Throughout NS	Small and medium-sized cold-water streams and rivers, occasionally in lake outlets. Can be found quite far upstream in small, permanent, fast-running streams. Occur in habitats characterized by low calcium carbonate levels which are especially well oxygenated. Commonly occurs in shallow sandy or gravel shoals, as well as in pools.	YES	NO
<i>Strophitus undulatus</i>	Creeper				2- May Be At Risk	From Nova Scotia to South Carolina; Cumberland Co., Westcolchester Co., NB Fundy Coast	Occurs in rivers and creeks but occasionally in lakes. Inhabits all substrates.	YES	NO
FISHES (MARINE)									
<i>Acipenser oxyrinchus</i>	Atlantic Sturgeon	No Status-No schedule		Threatened	2-May Be At Risk (Atlantic, 2005)	New Brunswick, Nova Scotia, Atlantic Ocean	Important habitat for Atlantic Sturgeon is a river with access to the sea, preferably with deep channels; an estuary with relatively warm, partially saline water and a coastal shelf region. Atlantic Sturgeon spawn in freshwater over rocky-gravel substrates at a depth of 1 - 3 m in areas with a strong current, and also under waterfalls, and in deep pools.	YES	Possible (marine environment)
<i>Alopias vulpinus</i>	Thresher Shark				3 -Sensitive (Atlantic, 2005)	Cosmopolitan in temperate and tropical seas	A pelagic oceanic species occurring at depths of 0 - 550 m, usually 0 - 200 m.	NO	Possible
<i>Amblyraja radiata</i>	Thorny Skate	No Status-No schedule		Special Concern- May/ 2012 (New)	2-May Be At Risk (Atlantic, 2005)	Nunavut, Quebec, New Brunswick, Prince Edward Island, Nova Scotia, Newfoundland and Labrador, Arctic Ocean, Atlantic Ocean	Occurs on the bottom over a wide range of depths (primarily 18-1200 m) and typically in water temperatures of 0° to 10°C. They can be found on a variety of bottom types including sand, gravel, mud and broken shells.	YES	Unlikely
<i>Anarhichas denticulatus</i>	Northern Wolffish	Threatened- Schedule 1		Threatened- November 2012 (No Change)	1- At Risk (Atlantic) (2005)	Arctic Ocean, Atlantic Ocean	The northern wolffish is a benthopelagic fish found in a broad range of depths, but most often at depths greater than 100 m in offshore waters over soft bottoms and in proximity to boulders at temperatures below 5°C; it is usually found in deep waters between 151 and 900 m.	YES	Unlikely
<i>Anarhichas lupus</i>	Atlantic Wolffish	Special Concern- Schedule 1		Special Concern- November 2012 (No Change)	3 -Sensitive (Atlantic, 2005)	Arctic Ocean, Atlantic Ocean	This species primarily inhabits the cold, deep waters of the continental shelf.	YES	Unlikely
<i>Anarhichas minor</i>	Spotted Wolffish	Threatened- Schedule 1		Threatened- November 2012 (No Change)	1- At Risk (Atlantic) (2005)	Arctic Ocean, Atlantic Ocean	Occurring in waters between 50 and 600 m deep and at temperatures lower than 5°C, it lives offshore over sand or mud bottoms and often in proximity to boulders.	YES	Unlikely
<i>Antimora rostrata</i>	Blue Hake				3 -Sensitive (Atlantic, 2005)	Occurs in all oceans	Deep water species, maximum catches reported at 1400 m depth.	NO	NO
<i>Anguilla rostrata</i>	American Eel	Threatened-May 2012 (In a higher risk category)			2- May Be At Risk		A variety of marine and freshwater habitats over the course of its life history.	YES	YES
<i>Brosme brosme</i>	Cusk	No Status-No schedule		Endangered- November 2012 (In a higher risk category)	1- At Risk (Atlantic) (2005)	Atlantic Ocean	Brosme are commonly taken on hard, rough, and rocky substrate). Fish in coral habitats tended to be larger in size than those in non-coral habitats.	YES	Unlikely

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Carcharodon carcharias</i>	White Shark	Endangered- Schedule 1		Endangered-April 2006 (New)	1- At Risk (Atlantic) (2005)	Atlantic Ocean	Occurs in both inshore and offshore waters, from the intertidal to the upper continental slope and mesopelagic zone. Known bathymetric range is from just below the surface to just above the bottom down to a depth of at least 1,280 m . It occurs in the breakers off sandy beaches, off rocky shores, and readily enters enclosed bays, lagoons, harbours, and estuaries, but does not penetrate brackish or fresh waters to any extent.	YES	Unlikely
<i>Coregonus huntsmani</i>	Atlantic Whitefish	Endangered- Schedule 1	Endangered	Endangered	1- At Risk (Atlantic) (2005)	Occurs only in the Tusket and Petite Riviere watersheds in southern Nova Scotia. Introduced to Anderson lake in Dartmouth.	The specific habitat requirements are largely unknown. It is salmon-like in that it spawns in freshwater and runs to sea in the spring. Most populations are land locked however.	NO	NO
<i>Cetorhinus maximus</i>	Basking Shark	No schedule-No Status		Special Concern- November 2009 (New)	2-May Be At Risk (Atlantic, 2005)	Atlantic Ocean	Areas where oceanographic events concentrate zooplankton appear to be the favoured summer habitat of Basking Sharks, typically including fronts where water masses meet, headlands, and around islands and bays with strong tidal flow. There is recent evidence that Basking Sharks also utilize deepwater habitats greater than 1000 m. The quality of foraging habitat changes over short spatial and temporal scales based on oceanographic conditions. Bycatch in fisheries is the most important known threat in the northwest Atlantic.	YES	Unlikely
<i>Coryphaenoides rupestris</i>	Roundnose Grenadier	No schedule-No Status		Endangered- November 2008 (New)	2-May Be At Risk (Atlantic, 2005)	Arctic Ocean, Atlantic Ocean	In the western North Atlantic, Roundnose Grenadier has been reported at depths between 200 and 2600 m.. Proportion of mature individuals tends to increase with depth. Reported preferred temperatures are 3.5-4.5°C in Canada, somewhat warmer in European waters. The species is reported to occur frequently some distance off bottom (ca 100 m) although factors affecting vertical movements are not well known.	YES	Unlikely
<i>Dipturus laevis</i>	Barndoor Skate			Not at Risk- November 2010 (New)	3 -Sensitive (Atlantic, 2005)	Western Atlantic: Grand Bank and southern Gulf of St. Lawrence in Canada to North Carolina, USA. Threatened with extinction by intensive trawling.	A demersal species, usually at depth range 0 - 750 m, usually 0 - 150	YES	NO
<i>Glyptocephalus cynoglossus</i>	Witch Flounder				3 -Sensitive (Atlantic, 2005)		lives on soft bottoms between 45 and 1460 m and prefers temperatures of 2-6 °C	NO	NO
<i>Gadus morhua</i>	Atlantic Cod	No Status-No schedule		Endangered-April 2010 (Reassigned)	3 -Sensitive (Atlantic, 2005)		Knowledge of the habitat requirements is rather poor, however it is reasonable to predict that habitat requirements change significantly with age in this species. Small resident non-migratory populations may exist in inshore bays and likely complete their life cycle in a restricted geographic area and hence have very different habitat requirements in comparison to migratory populations.	YES	YES
<i>Hippoglossoides platessoides</i>	American Plaice	No Status-No schedule		Threatened-April 2009 (New)	2-May Be At Risk (Atlantic, 2005)		Adult plaice prefer areas with sediment suitable for burrowing but the range of suitable particle sizes probably increases with fish size. Plaice may occupy non-preferential physical habitats (temperature, sediment type, etc.) in order to gain access to abundant prey.	YES	YES

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Hippoglossus hippoglossus</i>	Atlantic Halibut			Not at Risk- November 2011 (New)	2-May Be At Risk (Atlantic, 2005)	Temperate and arctic waters of the northern Atlantic, from Labrador and Greenland to Iceland, the Barents Sea and as far south as the Bay of Biscay and Virginia.	Demersal fish living on or near sand, gravel or clay bottoms at depths of between 50 and 2,000 m. Halibut are strong swimmers and are able to migrate long distances. Larvae are pelagic until they reach about 4m in length.	YES	YES
<i>Lamna nasus</i>	Porbeagle	No Status-No schedule		Endangered-May 2014 (No Change)	1- At Risk (Atlantic) (2005)	Atlantic Ocean	The porbeagle is a pelagic, epipelagic, or littoral shark that is usually more common on continental shelves, but is also found far from land in ocean basins and occasionally close inshore. Most porbeagle in Canadian waters occur between 5-10°C with little variation throughout the year, suggesting that they adjust their location to occupy this preferred temperature range	YES	Possible
<i>Lycodes vahlii</i>	Checker Eelpout				3 -Sensitive (Atlantic, 2005)		Checker eelpouts occur in the Atlantic from Davis Strait in the north, through the Gulf of St. Lawrence and the northern Scotian Shelf. They have been caught at depths ranging from 201–650 m, and in waters from 2.1°C to 4.5°C.	NO	NO
<i>Leucoraja ocellata</i>	Winter Skate	No Status-No schedule		Threatened-May 2005 (New)	3 -Sensitive (Atlantic, 2005)	Atlantic Ocean	Aa benthic species closely confined to sandy or gravelly bottoms.. On the Scotian Shelf, Scott and Scott (1998) indicate a preferred depth of 37–90 m. Winter skate have been reported in waters ranging between -1.2°and 19° C. On the Scotian Shelf, they are most frequently found at depths where temperatures range between 5°and 9° C). The salinity of the waters inhabited by skate typically ranges between 32.ppt and 34.4 ppt	YES	Possible
<i>Makaira nigricans</i>	Blue Marlin				3 -Sensitive (Atlantic, 2005)		Blue marlin are distributed throughout the tropical and subtropical waters of the Atlantic, Indian, and Pacific Oceans. A bluewater fish that spends the majority of its life in the open sea far from land, the blue marlin preys on a wide variety of marine organisms, mostly near the surface	NO	NO
<i>Macrourus berglax</i>	Roughead Grenadier			Special Concern- April 2007 (New)	2-May Be At Risk (Atlantic, 2005)	Atlantic Ocean	A benthopelagic species that can be found in the deep waters of the subarctic along the continental slope and on deep shelves. Predominant in depths ranging from 400 to 1200 m, although they may inhabit depths between 200- 2000 m	YES	Unlikely
<i>Morone saxatilis</i>	Striped Bass-Gulf of St. Lawrence population	Special Concern-No schedule		Special Concern- November 2012 (In a lower risk category)	1- At Risk (Atlantic) (2005)		Steady-flowing, turbid rivers that have low slopes and large estuaries, also marine	NO	NO
<i>Malacoraja senta</i>	Roughead Grenadier	Special Concern- No schedule		Special Concern	3 -Sensitive (Atlantic, 2005)	Quebec, New Brunswick, Prince Edward Island, Nova Scotia, Atlantic Ocean	These fish live on the sea bottom and prefer soft mud and clay substrates. They are found over a fairly wide range of depths although this is narrower at specific latitudes. The shallowest/deepest records of this species are 25/1436 m. The densest concentrations occur between 150 and 550 m. The fish are found over a relatively narrow range of temperatures, avoiding the coldest areas. The densest concentrations, comprising 90% of survey occurrences, were found where bottom temperature was between 3 and 10° C.	YES	Unlikely
<i>Nezumia bairdii</i>	Marlin-Spike Grenadier				3 -Sensitive (Atlantic, 2005)	Northwest Atlantic: Newfoundland, Canada to the northern end of the Straits of Florida, USA	Benthopelagic; non-migratory; depth range 16 - 1000 m, usually 90 - 700 m Benthic, reported as deep as 2295m. Taken much shallower in areas with cold surface waters	YES	Unlikely

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Pollachius virens</i>	Pollock				3 -Sensitive (Atlantic, 2005)		Common in northern parts of the Northern Atlantic, including the Bay of Biscay and Palmas Altas Campus. Adults can grow up to 130 centimetres (51 in) and weigh up to 32 kilograms (71 lb); the species is of great commercial value to fisheries. ^[5] The fish can be found close to the shore, particularly in rocky areas, but larger examples tend to be found around off-shore wrecks and reefs	YES	yES
<i>Prionace glauca</i>	Blue Shark				3 -Sensitive (Atlantic, 2005)		An oceanic and epipelagic shark found worldwide in deep temperate and tropical waters from the surface to about 350 meters	YES	Unlikely
<i>Salmo salar</i>	Atlantic Salmon	Endangered- Schedule 1		Endangered- November 2010 (New)	2- May Be At Risk (Atlantic, 2005), 4- Secure (NS, 2005)		Salmon move, as juvenile smolts or post-spawning 'kelts', from fresh water to brackish estuaries and then to the open ocean. Detailed information on migration routes and distribution is generally unavailable for specific populations.	YES	Unlikely
<i>Tetrapturus albidus</i>	White Marlin				3 -Sensitive (Atlantic, 2005)		Usually above the thermocline. Its distribution varies seasonally, reaching higher latitudes in both the northern and southern hemispheres only during the respective warm seasons. Usually found in deep (over 100 m) blue water with surface temperatures over 22 °C and salinities of 35 to 37 ppt.	NO	NO
<i>Squalus acanthias</i>	Spiny Dogfish	No Status- No schedule		Special Concern- April 2010 (New)	3 -Sensitive (Atlantic, 2005)	Spiny Dogfish occurs world-wide on the continental shelf, from the intertidal to the shelf slope, in temperate and boreal waters. In the northwest Atlantic, abundance is highest between Nova Scotia and Cape Hatteras (North Carolina).. The Atlantic Canada population is thought to consist of both resident and migrating components.	This species can survive in a variety of habitats, and have been observed at depths ranging from surface waters to 730 m, and from intertidal areas to well offshore. They are usually located where water temperatures are 5–15 °C and can tolerate a wide range of salinities, including estuarine waters. R	YES	Possible
<i>Thunnus alalunga</i>	Albacore				3 -Sensitive (Atlantic, 2005)		Undertakes feeding migrations to productive areas of the Northeast Atlantic during the summer. An epipelagic and mesopelagic, oceanic species that is abundant in surface waters of 15.6–19.4 °C. Deeper swimming, large albacore are found in waters of 13.5–25.2 °C. Temperatures as low as 9.5 °C may be tolerated for short periods.	YES	Possible
<i>Thunnus albacares</i>	Yellowfin Tuna				3 -Sensitive (Atlantic, 2005)		Pelagic waters of tropical and subtropical oceans worldwide.Seasonal migrants to Canadian waters in search of food	YES	Possible
<i>Thunnus obesus</i>	Bigeye Tuna				3 -Sensitive (Atlantic, 2005)		Found in the open waters of all tropical and temperate oceans. Seasonal migrants to Canadian waters in search of food.	YES	Possible
<i>Urophycis chesteri</i>	Longfin Hake				3 -Sensitive (Atlantic, 2005)	Western Atlantic: Canada to straits of Florida, found in the outer continental shelves and slopes, but not abundant to south of Cape Hatteras.	Epibenthic species most abundant between 360 and 800 m	NO	NO
<i>Urophycis chuss</i>	Red Hake				3 -Sensitive (Atlantic, 2005)	Northwest Atlantic: North Carolina to southern Nova Scotia, straying to the Gulf of St. Lawrence	Marine demersal species found at depths from 35 - 1152 m	NO	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Thunnus thynnus</i>	Bluefin Tuna	No Status- No schedule		Endangered-May 2011 (New)	2-May Be At Risk (Atlantic, 2005)	Atlantic Ocean	Atlantic Bluefin Tuna are seasonal migrants to Canadian waters in search of food. They arrive in summer and move southward in late fall. They may form schools, generally of less than 50 individuals (Scott and Scott 1988). Their spatial distribution is both coastal and oceanic . Two spawning locations are known: the western Atlantic population spawns in the Gulf of Mexico and the eastern Atlantic / Mediterranean population spawns in the Mediterranean.	YES	Likely - Fished Nearby
<i>Urophycis tenuis</i>	White Hake			Threatened- November 2013 (New)	2-May Be At Risk (Atlantic, 2005)	Western Atlantic: Labrador and the Grand Banks of Newfoundland to the coast of North Carolina.	Demersal species occurring at depths from 180 - 1000 m	YES	Possible
<i>Zoarces americanus</i>	Ocean Pout				3 -Sensitive (Atlantic, 2005)	Northwest Atlantic: Labrador, Canada to Delaware, USA.	Marine to brackish water demersal species found at depths from 0 - 388 m	YES	NO
MAMMALS									
<i>Balaenoptera musculus</i>	Blue Whale- Atlantic Population	Endangered- Schedule 1		Endangered-May 2012 (No Change)	1- At Risk (Atlantic) (2005)	Atlantic Ocean	Blue Whales range widely, inhabiting both coastal waters and the open ocean. Individuals belonging to the Atlantic population are frequently observed in estuaries and shallow coastal zones where the mixing of waters ensures high productivity of krill (small shrimp-like crustaceans about 2 cm long), the whales' main food.	NO	NO
<i>Balaenoptera physalus</i>	Fin Whale				3 -Sensitive (Atlantic, 2005)	Atlantic Ocean	Fin whales are associated with low surface temperatures and oceanic fronts during summer months. In the western North Atlantic, they are found from close inshore to well beyond the shelf break. The defining characteristic of fin whale feeding habitat is likely high concentrations of prey, particularly euphausiids and small schooling fish. Characteristics of preferred breeding grounds are unknown. In the North Atlantic, they eat euphausiids, capelin and herring, with considerable variation by location and time of year.	YES	NO
<i>Eubalaena glacialis</i>	Northern Right Whale	Endangered- Schedule 1		Endangered- November 2013 (No Change)	1- At Risk (Atlantic) (2005)	Atlantic Ocean	In Canadian waters, individuals congregate in the summer and fall in the lower Bay of Fundy, mainly east of Grand Manan Island, and in the vicinity of Roseway Basin between Browns and Baccaro banks on the western Scotian Shelf	YES	Unlikely
<i>Hyperoodon ampullatus</i>	Northern Bottlenose Whale-Scotian Shelf population	Endangered- Schedule 1		Endangered-May 2011 (No Change)	3 -Sensitive (Atlantic, 2005)	Atlantic Ocean	Occur in deep (>500m), northern waters of the North Atlantic, generally with depths between 800 and 1,500m, along the continental slope. These water depths seem to coincide with their dive depths, perhaps indicating that the whales often forage near the bottom.	NO	NO
<i>Mesoplodon bidens</i>	Sowerby's Beaked Whale	Special Concern- Schedule 1		Special Concern- November 2006 (No Change)	3 -Sensitive (Atlantic, 2005)	Atlantic Ocean	Sowerby's beaked whales are generally found in deep waters, including continental shelf edges and continental slopes. They have been observed in waters deeper than 1500m.	NO	NO
<i>Orcinus orca</i>	Killer Whale	No Status- No schedule		Not at Risk	3 -Sensitive (Atlantic, 2005)	Arctic Ocean, Atlantic Ocean	Killer Whales can tolerate wide ranges of salinity, temperature and turbidity, and their distribution appears to be determined mainly by the distribution and accessibility of their prey.	Unlikely	Unlikely

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Phocoena phocoena</i>	Harbour Porpoise			Special Concern	3 -Sensitive (Atlantic, 2005)	Northwest Atlantic population	Harbour porpoises are widely distributed over the continental shelves of the temperate Northern Hemisphere. Sometimes found in bays and harbours.	YES	YES
MAMMALS									
<i>Alces alces americana</i>	Eastern Moose- Mainland NS populaiton		Endangered-April 2010 (No Change)-		1- At Risk 1	Cobequid Mountains and Tobetic Wildlife Reserve, other small herds scattered throughout the Province	Young deciduous shrubs and trees.	YES	YES
<i>Glaucomys volans</i>	Southern Flying Squirrel- NS population			Not at Risk-April 2006 (Reassigned)	3- Sensitive	In Canada, Southern Flying Squirrels are found in southern Ontario, southwestern Québec and southern Nova Scotia.	Southern Flying Squirrels inhabit hardwood forests in eastern North America. Dead hollow trees are used as den sites.	NO	NO
<i>Lynx canadensis</i>	Canada Lynx		Endangered -2002	Not at Risk-May 2001 (No Change)	1- At Risk 1	Highlands of Cape Breton Island	Dense climax Boreal Forest with a dense undercover of thickest and windfalls.	NO	NO
<i>Martes americana</i>	American Marten		Endangered -2001		1- At Risk 1		Mature softwood forest.	NO	NO
<i>Martes pennanti</i>	Fisher				3- Sensitive	Throughout NS. Mostly in Cumberland, Colchester and Pictou Counties	Mixed forests.	NO	YES
<i>Myotis lucifugus</i>	Little Brown Myotis	No status-No schedule	Endangered -2013	Endangered November 2013 (No Change)	3- Sensitive	Nova Scotia, Newfoundland, Labrador, Quebec, West	Caves, mine tunnels, hollow trees, buildings. Dead trees close to lakes and ponds. Hibernates in caves. Colonial. Most hibernate together in caves.	NO	YES
<i>Myotis septentrionalis</i>	Northern Long-eared Myotis	No status-No schedule	Endangered -2013	Endangered November 2013 (No Change)	3- Sensitive	Nova Scotia, New Brunswick, Newfoundland	Dense forest and caves.	NO	YES
<i>Sorex dispar</i>	Long-tailed Shrew				3- Sensitive	Only known in Cumberland and Colchester Counties	Talus slopes and rock slides in deciduous and coniferous forests. Mountainous regions.	NO	NO
<i>Sorex gaspensis</i>	Gaspé Shrew	Not at Risk- Schedule 3		Not at RiskApril 2006 (No longer at risk)	3- Sensitive	At the present time there are four populations of the Gaspé Shrew in Canada: one in the Gaspé peninsula, two in New Brunswick, and one in northern Nova Scotia.	The Gaspé Shrew prefers rock outcrops and talus slopes in highlands where there are steep slopes.	NO	NO
MOLLUSCS									
<i>Barnea truncata</i>	Atlantic Mud-piddock	No Status- No schedule		Threatened- November 2009 (New)	1- At Risk (ATLANTIC)	One location in the Minas Basin	This intertidal marine bivalve species bores into hard clay and soft rock, and in Canada is entirely dependent on a single geological formation, the red-mudstone facies within the Minas basin. The total available habitat for this species is < 0.6 km ² . This species settles on and bores into the mudstone, and once settled, is immobile.	NO	NO
REPTILES (MARINE)									
<i>Caretta caretta</i>	Loggerhead Turtle	No schedule- No Status		Endangered-April 2010 (New)	1- At Risk (Atlantic) (2005)	Atlantic Ocean	Juvenile Loggerhead Sea Turtles are found routinely in Atlantic Canadian waters well offshore on the Scotian Shelf, Scotian Slope, Georges Bank, the Grand Banks, and waters further offshore. Research suggests Loggerhead Sea Turtles are present in Canadian waters in greatest numbers during the spring, summer and fall.	NO	NO

SCIENTIFIC NAME	COMMON NAME *	SPECIES AT RISK ACT Status & Schedule	NOVA SCOTIA ENDANGERED SPECIES ACT	COMMITTEE ON THE STATUS OF WILD SPECIES IN CANADA	GENERAL STATUS OF WILD SPECIES IN CANADA- NS /Atlantic	REGION	HABITAT	Step 2 - Possible Occurrence in Region?	Step 3- Possible Occurrence on Site based on habitats present
<i>Dermochelys coriacea</i>	Leatherback Turtle	No schedule- No Status		Endangered-May 2012 (Reassigned)	3 -Sensitive (Atlantic, 2010)	Atlantic Ocean	Migratory speces which breeds in tropical or subtropical waters and moves to temperate waters in search of food (chiefly jellyfish) at other times of the year. Leatherbacks in Atlantic Canada occur in both offshore and coastal waters (range 2 to 5,033 m depth). Most sightings are from continental shelf (waters inside the 200 m isobath). Median depth of sightings is 113 m and mean sea surface temperature (SST) is 16.6 °C.	YES	Possible

BLACK POINT QUARRY AIR DISPERSION MODELLING STUDY

February 6, 2015

1.0 INTRODUCTION

Vulcan Materials Company (Vulcan) retained Stantec Consulting Ltd. (Stantec) to conduct a dispersion modelling study of air contaminant emissions from the operation of the proposed development of a granite rock quarry and marine terminal at Black Point in Guysborough County, Nova Scotia (NS). This study was conducted to support the Environmental Impact Statement being prepared by Vulcan for the Project.

Dispersion modeling was completed Dispersion modeling was completed using AERMOD, developed by the American Meteorological Society (AMS) and United States Environmental Protection Agency (US EPA). AERMOD is the US EPA preferred model for regulatory air dispersion modelling of industrial sources and Nova Scotia Environment (NSE) has approved its use in various modelling projects to demonstrate compliance in Nova Scotia.

Air contaminants that are of most concern from project operations include total suspended particulate (TSP), particulate matter less than 10 and 2.5 microns in diameter (PM₁₀ and PM_{2.5}, respectively), nitrogen oxides (NO_x), carbon monoxide (CO) and sulphur dioxide (SO₂). Table 1.1 shows the air contaminants and averaging times modeled in this study. Also shown in Table 1.1 are the applicable regulatory thresholds for each contaminant and averaging time.

Contaminant	Averaging Period	Regulatory Threshold (µg/m³)	
		Federal ¹	Provincial ²
Total Suspended Particulate (TSP)	24-hour	-	120
	Annual	-	70
Particulate Matter Less than 10 microns (PM ₁₀)	24-hour	-	-
Particulate Matter Less than 2.5 microns (PM _{2.5})	24-hour	28 (2015) 27 (2020)	-
	Annual	10 (2015) 8.8 (2020)	-
Sulphur Dioxide (SO ₂)	1-hour	-	900
	24-hour	-	300
	Annual	-	60
Nitrogen Dioxide (NO ₂)	1-hour	-	400
	Annual	-	100
Carbon Monoxide (CO)	1-hour	-	34600
	8-hour	-	12700

²Nova Scotia Air Quality Regulations (N.S. Reg. 179/2014)

February 6, 2015

This report is presented in five sections. General information and the dispersion modelling methodology are presented in Sections 1 and 2. The results of the dispersion modelling are presented and discussed in Section 3, and the conclusions of the study and closure are presented in Sections 4 and 5, respectively. References are provided in Section 6.

2.0 DISPERSION MODELLING

2.1 MODEL DESCRIPTION

The most recent version of the plume dispersion model AERMOD was used for this project (version 14134). AERMOD is the US EPA preferred model for regulatory air dispersion modelling of industrial sources and Nova Scotia Environment (NSE) has approved its use in various modelling projects to demonstrate compliance in Nova Scotia.

It is applicable to rural and urban areas, flat and complex terrain, surface and elevated releases, and multiple sources (including, point, area and volume sources). AERMOD currently contains algorithms for:

- dispersion in both the convective and stable boundary layers;
- plume rise and buoyancy;
- plume penetration into elevated inversions;
- treatment of elevated, near-surface, and surface level sources;
- computation of vertical profiles of wind, turbulence, and temperature; and
- the treatment of receptors on all types of terrain (from the surface up to and above the plume height).

Terrain handling is done with a simple approach while still considering the dividing streamline concept in stable-stratified conditions. Where appropriate, the plume is modelled as either impacting and/or following the terrain.

2.2 MODELLING METHODOLOGY

2.2.1 Overview of Project Interactions with Air Quality

This air dispersion modelling study has been conducted in support of the preparation of the Environmental Impact Statement for the proposed development, operation and decommissioning and abandonment of a granite quarry and marine terminal at Black Point in Guysborough County. It is common and accepted practice to use mathematical dispersion modeling techniques to simulate the transport of contaminants released from a proposed operation, and to compare the concentrations at significant points of reception (all of which

BLACK POINT QUARRY AIR DISPERSION MODELLING STUDY

February 6, 2015

are residences in this project) to the applicable limits. In order to do this, the project must be represented in the model in terms of activities which result in the emissions of air contaminants. In this project, activities responsible for such emissions are primarily internal combustion engine operation, mechanical abrasion, wind erosion, and blasting.

The proposed Project will involve the extraction and processing of granite rock using industry standard drilling, blasting, crushing, screening and washing procedures, stockpiling on site and loading into Panamax-sized bulk carrier ships via a deep water marine terminal. During peak production the anticipated annual production rate is 7.5 MT per year, which equates to roughly 5.0 MT per year of salable product.

To predict the potential effects that the operation of the proposed Project could have on air quality within and surrounding the proposed Project area air dispersion modelling was conducted. To capture the potential "worse case" operating scenario ground level concentrations were predicted for Phase 5 of the Project, which represents peak production and includes the greatest amount of mobile combustion equipment. Phase 3 of the project was also modeled due to the need for large diesel power generators on site.

2.2.2 Modeling Inputs

Input preparation for the dispersion modelling study consists of three main components:

- 1) Meteorological data acquisition and pre-processing;
- 2) Receptor grid and terrain data processing; and
- 3) Source and emissions characterization

These components are described briefly in the following sections.

2.2.2.1 Meteorology Data

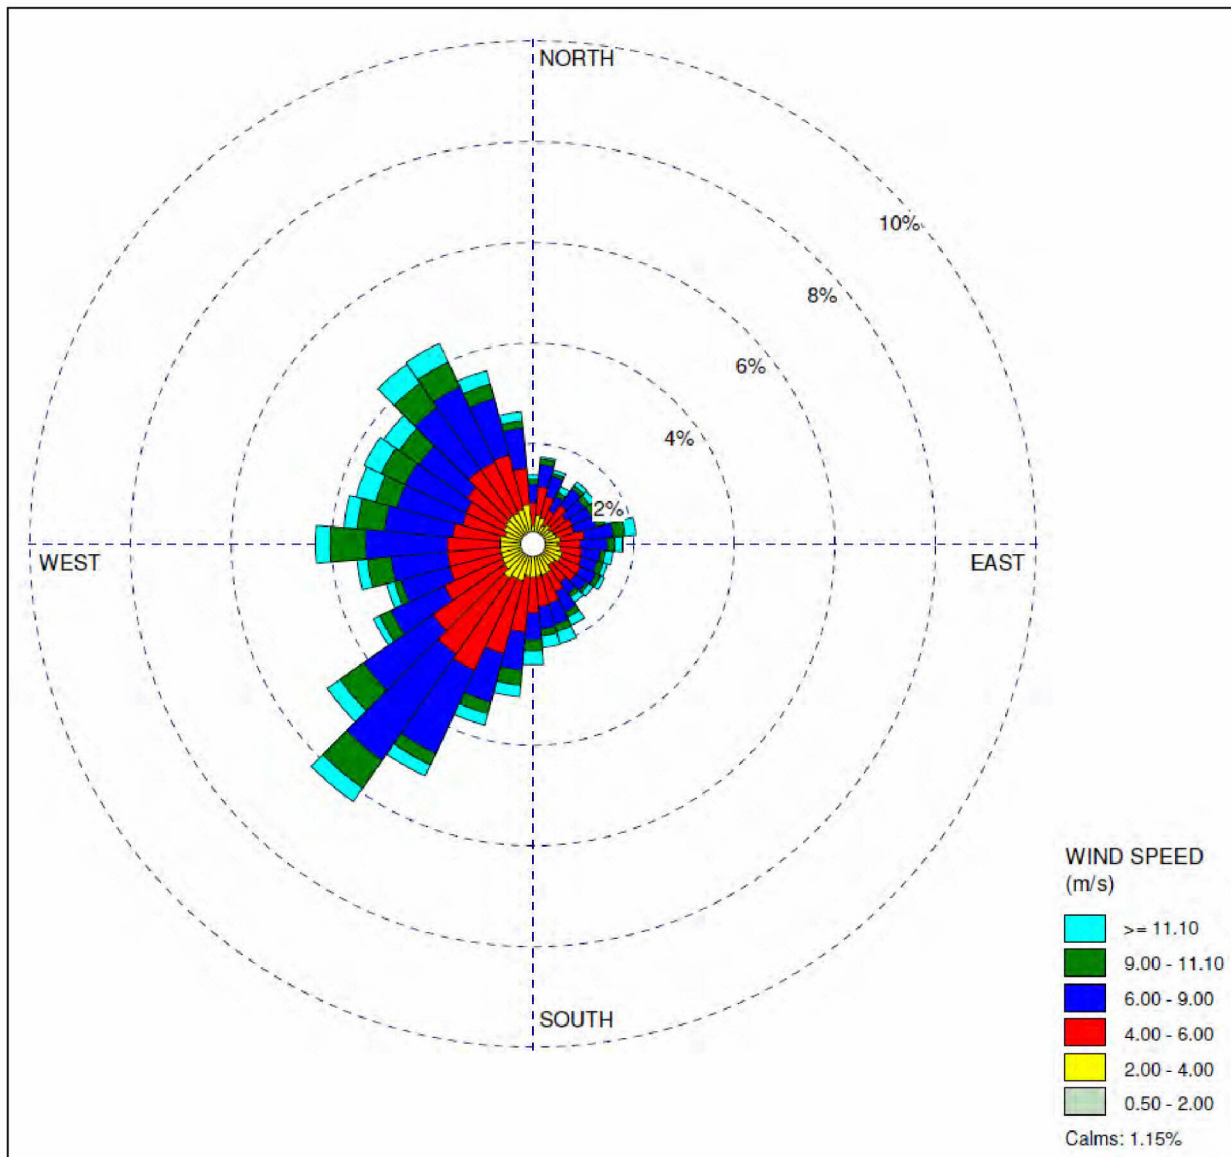

The accuracy of a dispersion model is dependent on the quality of meteorological data. For this dispersion modeling study, meteorological data preprocessed for use in AERMOD was acquired from Lakes Environmental for 2009 through 2013, inclusive. The data were generated using the MM5 meteorological model developed by the National Center for Atmospheric Research. The MM5 dataset comes ready to be immediately integrated into AERMET, the meteorological sub model for the AERMOD dispersion modeling system.

A joint wind direction and speed frequency diagram, or "wind rose", of these data is presented in Figure 2.1 (conventionally, wind roses show the direction from which the wind blows). Winds near the proposed quarry are dominated by north westerly winds hugging the coastline along the Atlantic Ocean, with appreciably frequent winds from the southwest. Winds are typically moderate to high with few calm periods, as expected from a coastal region.

February 6, 2015

Figure 2.1 Joint Wind Speed and Frequency Wind Rose near Project Location

2.2.2.2 Receptor Grid and Terrain Data

AERMOD predicts ground-level concentrations at defined receptor locations. Straight-line plume transport is assumed to occur between the source and the downwind receptors. The Receptor Plan, which illustrates the locations of the receptors modelled, is presented in Figure 2.2.

A 10 km x 10 km nested Cartesian receptor grid was created with the quarry near the center. A grid spacing of 50 m was established from the property boundary to 500 m, 100 m spacing

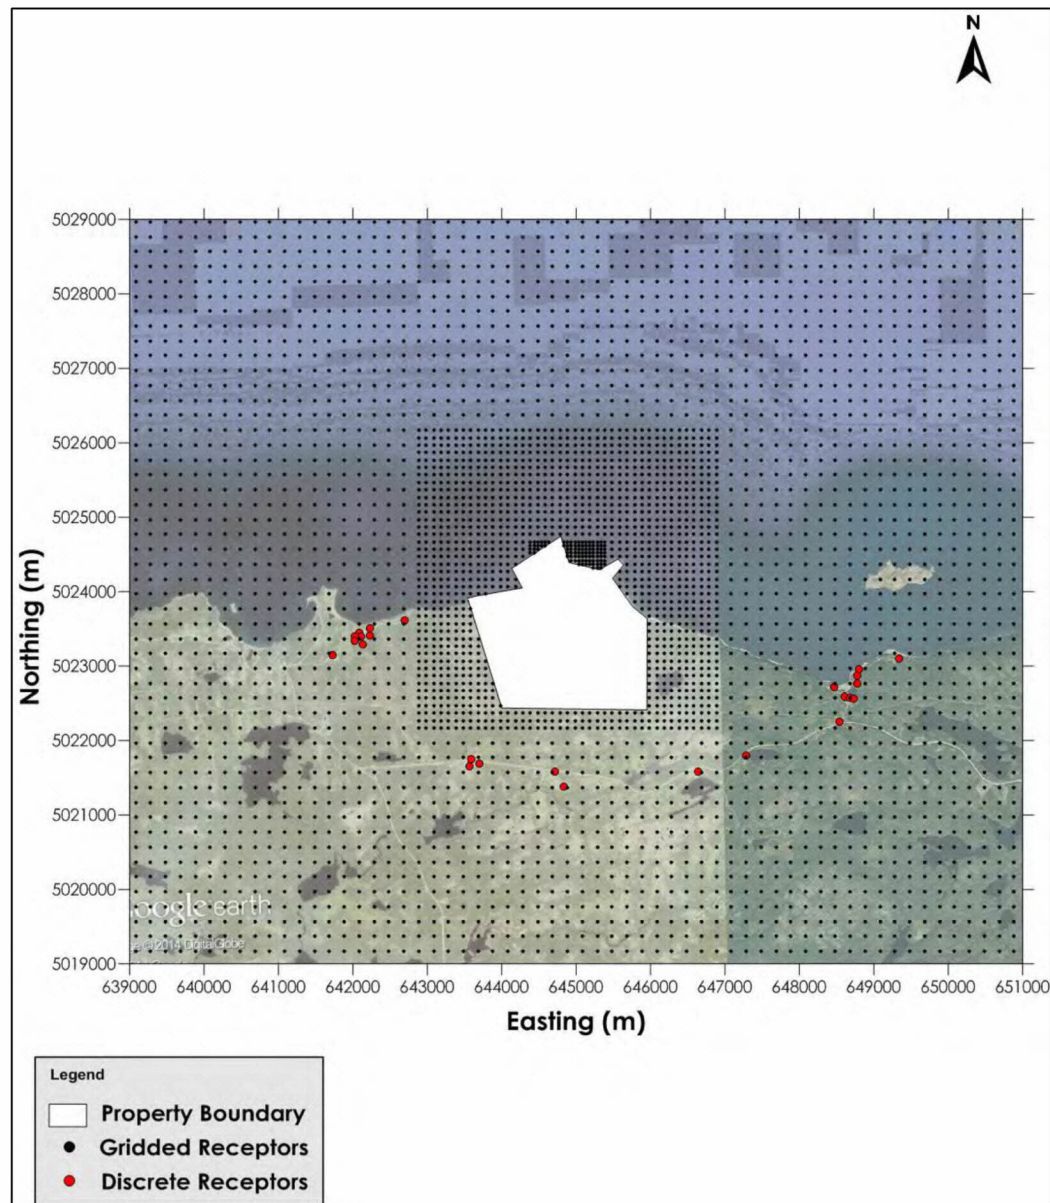

BLACK POINT QUARRY AIR DISPERSION MODELLING STUDY

February 6, 2015

between 500 m and 1,500 m from the property line, and 200 m spacing from 1,500 m to 5,000 m. Twenty-five discrete receptors, representing the nearest residents to the Project site (based on well location information) were also included in each model. These locations are also presented in Figure 2.2.

Figure 2.2 Receptor Locations for Dispersion Modeling

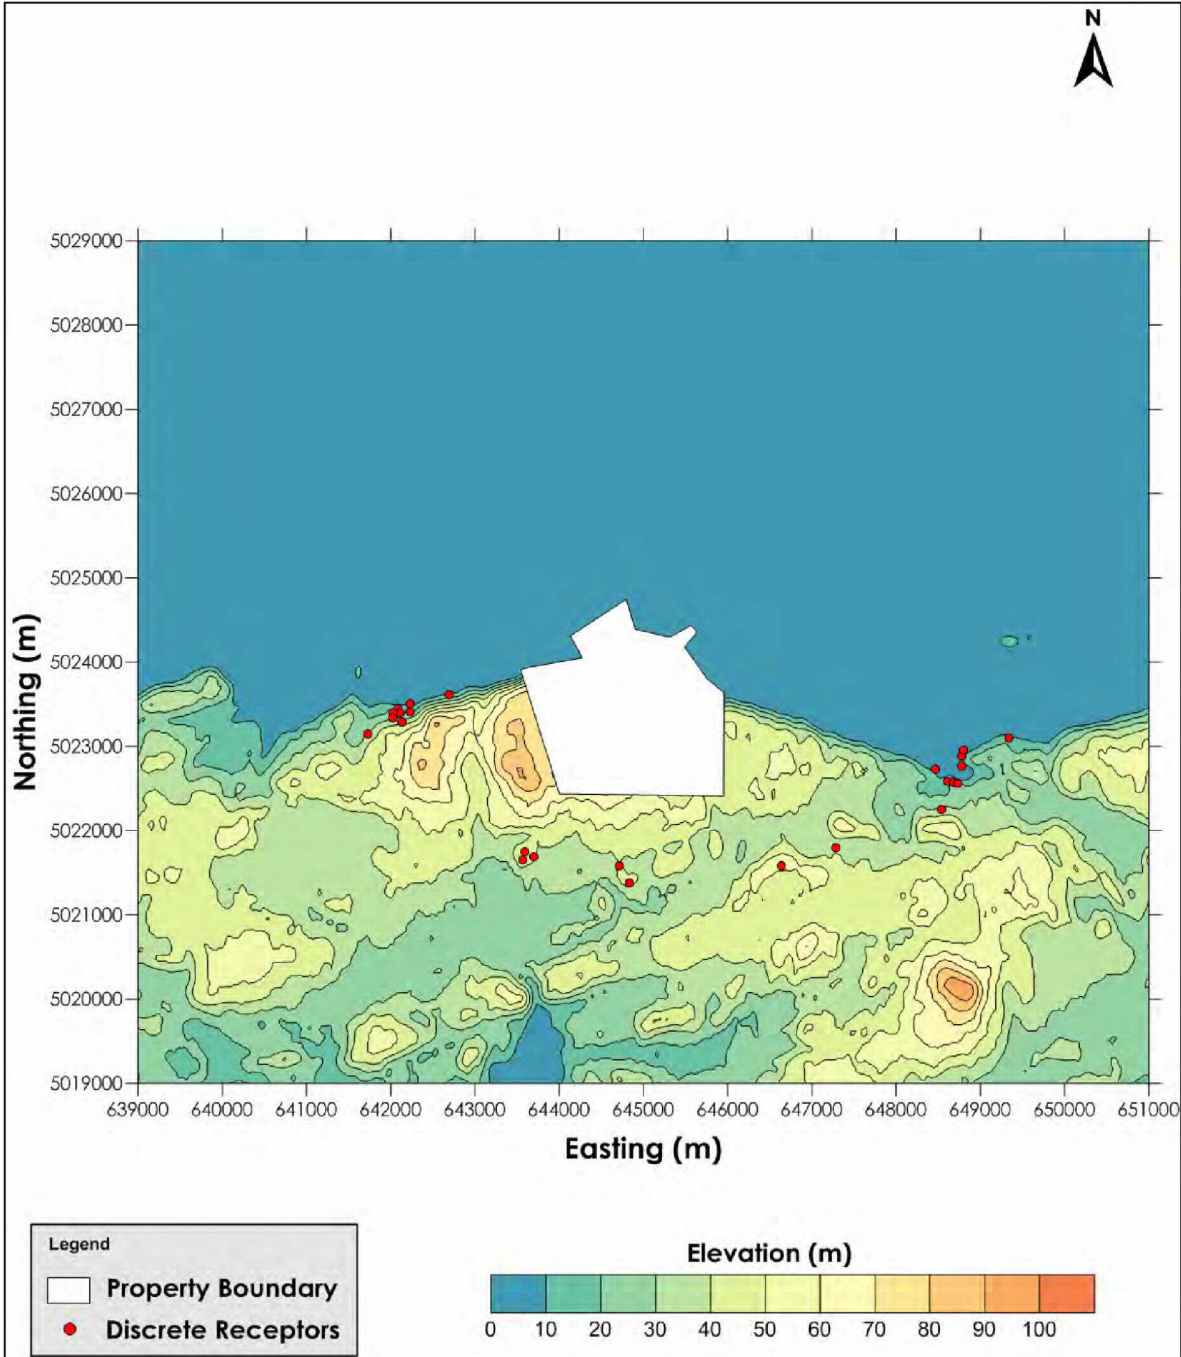

Terrain elevation data for sources and receptors were obtained from Natural Resources Canada's Canadian Digital Elevation Data (CDED) dataset using their Digital Elevation Model

BLACK POINT QUARRY AIR DISPERSION MODELLING STUDY

February 6, 2015

(DEM) at a grid resolution range of 0.75 to 3 arc-seconds depending on latitude. Terrain contours based on the CDED DEM are illustrated in Figure 2.3.

Figure 2.3 Terrain Elevations for Dispersion Modeling

February 6, 2015

2.2.2.3 Source Characteristics

Source information data is required by AERMOD to characterize the release of air contaminants during Project operations. The operation of the proposed Project will involve the following activities:

- Rock quarrying (drilling and blasting);
- Rock haulage;
- Processing of the extracted rock (crushing, screening, washing, conveying, storage, reclaiming); and
- Ship loading.

The main sources of air emissions from the above activities are released through fuel combustion from drills, haul trucks, loaders and other earth-moving equipment, power generators, ship hotelling during product loading, blasting, and fugitive releases of dust from material handling and haul truck travel on unpaved roads.

As defined by the United States Environmental Protection Agency (US EPA 1995), fugitive dust is dust that is released to the atmosphere from open sources instead of being discharged to the atmosphere via a confined flow stream, and is created from the mechanical disturbance of granular material. Fugitive dust can remain suspended during airborne transport when less than 30 microns in diameter and this threshold is typically used to estimate emissions of TSP. Emissions of PM₁₀ and PM_{2.5} are further estimated as a source-dependent fraction of TSP.

Fugitive releases of dust will occur during Project operations through the following operational activities:

- Drilling and blasting;
- Material handling – through the loading and unloading of extracted rock, stockpiling, reclaiming, conveying and conveyor transfer points, and ship loading;
- Processing of the ore – crushing, screening and washing;
- Unpaved road travel –Haul truck travel on unpaved roads; and
- Wind erosion – rock stockpiles.

Several measures for mitigating particulate emissions during the operation of the Project are planned and include, but are not limited to, the following:

- Use of qualified blasting contractors with blast design plans that incorporate dust emission controls;
- Use of water suppression on unpaved roads and working areas;

BLACK POINT QUARRY AIR DISPERSION MODELLING STUDY

February 6, 2015

- Construction of the haul roads using material with a low silt content;
- Use of a binder substance within the dust suppression application (e.g. calcium chloride) during drier periods of the year to aid in keeping the roads moist for longer periods of time;
- Dust collection systems and/or wet sprays on conveyor transfer points to reduce the fugitive releases of dust during the transfer of material; and
- Water sprays on the crushed rock stockpiles and transfer points.
- Dust suppression systems for secondary and tertiary crushing units, and
- Enclosures for screening towers

See Section 3.5 for additional information regarding on site mitigation.

The source information and emission rates required for the dispersion modelling study were obtained primarily from information provided to Stantec from Vulcan, with the exception of the emissions from the bulk carriers during product loading. Ship hotelling emissions were calculated using US EPA guidance as per the following document, "Current Methodologies in Preparing Mobile Source Port-Related Emission Inventories" (2009).

Emissions related to blasting within the quarry pit were not included in the dispersion model but were handled separately because the impact over longer time periods is very small.

As discussed above, stockpiles can also be a source of fugitive particulate emissions during quarry operations. The stockpiles planned for this Project will be equipped with rain birds and the water trucks used for dust suppression will be equipped with a canon to further provide wet suppression to these piles during times when needed. Further, most piles are prescreened and washed so that the fines that would generate airborne dust have been removed. As such emissions can be managed to the point where emissions of dust will be negligible they were not included as sources within the dispersion modelling.

2.2.2.3.1 Phase 3

Tables 2.1 and 2.2 present the point source parameters and emission factors used for dispersion modeling, respectively. Source parameters and emission rates for volume sources and pit sources can be found in Tables 2.3 and 2.4, respectively. Emission rates are prorated in the tables by duty cycles for the averaging periods specified.

Table 2.8 Phase 5 Pit Source Information

Source	Release Height (m)	Volume of Pit (m ³)	Area of Pit (m ²)	Emission Factor (g/s) ^{1,2}				
				TSP		PM ₁₀	PM _{2.5}	
				24-hr	Annual	24-hr	24-hr	Annual
Pit	4.5	43,750,000	1,250,000	1.02	0.627	0.326	0.113	0.017

¹ Emissions include: (1) fugitive emissions from travel on unpaved haul roads and drilling; (2) 90% control applied to haul roads to account for wet suppression.

² Calculated from US EPA AP-42 Chapter 13.2.2, and information provided by Vulcan

February 6, 2015

2.2.2.4 Building Downwash

Downwash effects due to wind interaction of aerodynamic masses and emission sources can be modeled using AERMOD. Air contaminants released within the wake zone of buildings can be drawn down to the ground sooner than if release at higher elevations, and can change the ground-level concentration profile.

AERMOD implements downwash modeling using the Plume Rise Model Enhancements (PRIME) submodel. PRIME allows for streamline ascent/descent effects and enhanced dilution due to building induced turbulence. PRIME addresses the entire structure of the building wake, from the cavity immediately downwind of the building, to the far wake zone (US EPA 1997).

To model building downwash in AERMOD, wind direction dependent building information such as width and height were provided to Stantec by Vulcan. The Building Profile Input Program (BPIP) submodel in AERMOD was then used to generate dispersion parameters representing building downwash.

2.2.3 Existing Air Quality

Background air contaminant concentrations are typically added to the maximum predicted concentrations for comparison with the regulated ambient air quality objective or standard. Background concentrations are usually based on measured ambient air quality data from the nearest representative monitoring station. In this study, there is no ambient air quality monitoring station located near the Project site that could be reasonably used to characterize the existing air quality within the Project area. The closest monitoring station is located in Port Hawkesbury, approximately 30 km north of the Project, which is representative of an urban area containing industrial activity. As a result, based on its rural location, the background concentrations for this study are assumed to be negligible.

For a reference, the ambient concentrations (annual means) of SO₂, CO, PM_{2.5} and NO₂ as measured in Port Hawkesbury are presented in Table 2.9.

Table 2.9 Summary of 2013 Annual Mean Ambient Air Quality Monitoring Data from Port Hawkesbury and Sydney, Nova Scotia

Contaminant	Annual Mean (µg/m ³)*	Station Location
PM _{2.5}	6	Port Hawkesbury
NO ₂	9.4	Port Hawkesbury
CO	0.1**	Sydney
SO ₂	2.6	Sydney

*Source: Environment Canada

**Data from 2012

February 6, 2015

2.2.4 NO_x Conversion

Oxides of nitrogen (NO_x) comprise nitric oxide (NO) and nitrogen dioxide (NO₂). Most combustion sources emit primarily NO that can react with ambient ozone (O₃) to produce NO₂. The final quantity of NO₂ then becomes a function of the available O₃ in the atmosphere during the release.

Only ground-level concentrations of NO₂ are regulated in Nova Scotia. The US EPA three-tiered screening approach was used to consider conversion of NO to NO₂ (US EPA 2012). The tiered approach is as follows:

- **Tier 1** – assume complete conversion of all emitted NO to NO₂;
- **Tier 2** – multiply Tier 1 results by a representative equilibrium NO₂/NO_x ratio (e.g. ambient ratio method - ARM); and
- **Tier 3** – perform detailed analysis on a case by case basis (e.g. ozone limiting method - OLM).

The Tier 2 approach was applied in the study. An NO₂/NO_x in stack ratio of 0.2 was applied to the NO_x emissions for all sources of diesel combustion for both operational phases.

3.0 DISPERSION MODELLING RESULTS

3.1 PHASE 3 OPERATIONS

3.1.1 Particulate Matter

The highest predicted 24-hour maximum and annual average ground-level concentrations (GLCs) for total suspended particulate matter (TSP) and particulate matter less than 2.5 microns in diameter (PM_{2.5}) at each discrete receptor location for Phase 3 are presented in Table 3.1. The highest predicted 24-hour maximum for particulate matter less than 10 microns in diameter (PM₁₀) are also presented in this table. Background concentrations of particulate matter in the Project area are assumed to be negligible.

Regulatory Limit	-	-	120	70	-	28	10

Isopleths of maximum predicted GLCs for 24-hour TSP can be found in Figure A.1 in Appendix A. GLCs for 24-hour TSP are highest on the shore on the northeastern corner of the property boundary. The highest 24-hour TSP GLC for the discrete receptors is 61 $\mu\text{g}/\text{m}^3$ occurring at Receptor 1, approximately 50% of the provincial maximum permissible value of 120 $\mu\text{g}/\text{m}^3$.

The highest predicted annual TSP GLC is 0.71 $\mu\text{g}/\text{m}^3$ and occurs at Receptor 18. Annual TSP GLCs are predicted to be well below the maximum permissible value of 70 $\mu\text{g}/\text{m}^3$.

Isopleths of maximum predicted GLCs for 24-hour PM_{2.5} can be found in Figure A.2 in Appendix A. GLCs for 24-hour PM_{2.5} are highest near the western side of the property boundary. The

BLACK POINT QUARRY AIR DISPERSION MODELLING STUDY

February 6, 2015

highest 24-hour PM_{2.5} GLC for the discrete receptors is 7.39 µg/m³ and occurs at Receptor 14, or approximately 25% of the Canada-wide Standard of 28 µg/m³. The maximum annual average GLC for PM_{2.5} was predicted to be 0.049 µg/m³, occurring at Receptor 18, well below the Canada-wide Standard of 10 µg/m³.

3.1.2 Combustion Gases

The highest predicted 1-hour and annual average ground-level concentrations for nitrogen dioxide (NO₂) at each discrete receptor for Phase 3 are presented in Table 3.2. Background concentrations of NO₂ in the Project area are assumed to be negligible.

Table 3.2 Maximum Predicted Ground Level Concentrations of Nitrogen Dioxide at Discrete Receptor Locations - Phase 3

BLACK POINT QUARRY AIR DISPERSION MODELLING STUDY

February 6, 2015

The predicted 1-hour maximum ground-level concentrations of NO₂ are presented in Figure A.3 in Appendix A. The highest ground-level concentrations are predicted to occur near the western side of the property boundary. The highest 1-hour NO₂ GLC for the discrete receptors is 75.6 µg/m³ occurring at Receptor 6, approximately 20% of the provincial regulatory threshold of 400 µg/m³. The maximum annual average GLC for NO₂ was predicted to be 0.094 µg/m³, occurring at Receptor 16, well below the Provincial regulatory limit of 100 µg/m³.

Maximum predicted GLCs for CO and SO₂ can be found in Tables 3.3 and 3.4, respectively. GLCs for both contaminants were predicted to be well below regulatory thresholds for all averaging periods.

Isopleths of maximum predicted GLCs for 24-hour TSP can be found in Figure B.1 in Appendix B. GLCs for 24-hour TSP for Phase 5 are predicted to continue to be highest on the shore on the northern edge of the property boundary. The highest 24-hour TSP GLC for the discrete receptors is 58.1 µg/m³ occurring at Receptor 12, approximately 50% of the provincial maximum permissible value of 120 µg/m³.

BLACK POINT QUARRY AIR DISPERSION MODELLING STUDY

February 6, 2015

The highest predicted annual TSP GLC is $1.44 \mu\text{g}/\text{m}^3$ and occurs at Receptor 18. Annual TSP GLCs are predicted to be well below the maximum permissible value of $70 \mu\text{g}/\text{m}^3$.

Isopleths of maximum predicted GLCs for 24-hour $\text{PM}_{2.5}$ can be found in Figure B.2 in Appendix A. GLCs for 24-hour $\text{PM}_{2.5}$ are highest near the western side of the property boundary. The highest 24-hour $\text{PM}_{2.5}$ GLC for the discrete receptors is $5.74 \mu\text{g}/\text{m}^3$ occurring at Receptor 16, approximately 25% of the Canada-wide Standard of $28 \mu\text{g}/\text{m}^3$. The maximum annual average GLC for $\text{PM}_{2.5}$ was predicted to be $0.08 \mu\text{g}/\text{m}^3$, occurring at Receptor 14, well below the Canada-wide standard of $10 \mu\text{g}/\text{m}^3$.

3.2.2 Combustion Gases

The highest predicted 1-hour and annual average GLCs NO_2 at each discrete receptor for Phase 5 are presented in Table 3.6. Background concentrations of NO_2 in the Project area are assumed to be negligible.

25	649335	5023096	11.3	0.048
Regulatory Limit	-	-	400	100

The predicted 1-hour maximum GLCs of NO₂ are presented in Figure B.3 in Appendix B for Phase 5. The highest ground-level concentrations are predicted to occur near the western side of the property boundary. The highest 1-hour NO₂ GLC for the discrete receptors is 17.8 µg/m³ occurring at Receptor 14, well below the provincial regulatory threshold of 400 µg/m³. The maximum annual average GLC for NO₂ was predicted to be 0.101 µg/m³, occurring at Receptor 15, also well below the Provincial regulatory threshold of 100 µg/m³.

Maximum predicted GLCs for CO and SO₂ for Phase 5 can be found in Tables 3.7 and 3.8, respectively. GLCs for both contaminants were predicted to be well below regulatory thresholds for all averaging periods.

3.3 BLASTING

Blasting is a short term event resulting in a near-instantaneous puff of air contaminants to be carried downwind. The emissions are dispersed horizontally and vertically, as in continuous plumes, and also are dispersed in the direction of the wind due to turbulence and wind shear. For this Project, the effects of a single blast were calculated on a worst-case basis, and used to derive the daily and annual impacts.

The basic puff model was derived by Turner (1994) and enhanced in the work by Schulze and Turner (1996). The period of maximum production used to calculate particulate concentrations downwind was based on a 50 hole-average blast. A low wind speed (low dilution) has been used, and temperature was assumed to be ambient to reduce thermal plume rise. Deposition is assumed to be negligible so that the estimates are a reasonable worst-case. Based on information provided by Vulcan, the estimated TSP and PM_{2.5} generated by the blast is 9.7 kg and 0.3 kg, respectively.

The maximum 24 hour GLC of PM_{2.5} at the nearest resident distance of 500 m was predicted to be 0.15 µg/m³, well below the Canada-wide standard of 28 µg/m³. Long term averages would be much lower due to wind direction and speed variability. As shown by the wind rose in Figure 2.1, winds blow in the same direction less than 7% of the time toward any given receptor. At a maximum of 182 blasts per year, the annual average GLC would be well below the annual Canada-Wide Standard of 10 µg/m³. The results here are therefore expected to represent an over-estimate of the anticipated exposure levels to nearby residents.

3.4 SHIP TRANSIT

Ships approaching and berthing at the dock will have emissions from propulsion engines, while docked ships run onboard power requirements via "hotelling" emissions from the auxiliary power units. Although emissions from the propulsion engines are larger than the auxiliary units, propulsion unit are expected to operate for a much shorter duration and will be non-stationary; that is, the plume is only a temporary exposure due to ship motion. Virtually all of North America,

February 6, 2015

including the project area, is within an Emission Control Area (ECA) protected by International Maritime Organization (IMO) regulations that reduce the acceptable levels of NO_x and SO₂ from marine engines. In January 2016, Tier III limits replace those of Tier II, with a consequent reduction in NO_x of about 74% in ECAs that include all of coastal Nova Scotia. With these reductions, model predictions for NO_x indicate that hourly limits for NO_x would be met on the order of 100 m from a steaming vessel. The expected exposure for hourly and annual averaging periods is therefore expected to be well below regulatory thresholds as vessels are expected to be of the order of 1 km offshore of any residences.

3.5 ADAPTIVE MANAGEMENT

In addition to mitigation measures identified in Section 2.2.2.3, additional controls will be implemented through adaptive management. Adaptive management is a systematic application of monitoring programs to learn optimum procedures for reducing exposure from air contaminants. For example, dust generation from haul roads is a function of several factors including moisture in the roadway and speed of the vehicle. Through adaptive management, the proponent may learn that immediate reductions are possible through speed reductions, while watering trucks may be deployed as a more long-term control that does not compromise productivity. Adaptive management therefore implies a willingness by quarry operators to continually monitor conditions on site and respond to changing environmental conditions to achieve predicted control efficiencies.

One contributing source to the overall impacts that can be controlled through adaptive management is the removal of overburden. This is an essential part of the development of the quarry, but is not an activity that needs to be continuous in order to sustain maximum production. It will be possible to incorporate in mitigation planning the suspension of activities such as overburden removal until such times that soil moisture conditions provide greater control on the emissions that will be generated, and the weather promotes adequate dispersion of any material that is released.

4.0 CONCLUSIONS

Air quality impacts of the quarry were estimated using a dispersion modelling approach to calculate ground level concentrations to be compared against applicable provincial and federal standards. The plume dispersion model AERMOD was used to predict the 1-hour and 24-hour maximum, and the annual average concentrations for nitrogen dioxide (NO₂), sulphur dioxide (SO₂), and particulate matter (including TSP, PM₁₀ and PM_{2.5}), as well as the 1-hour and the 8-hour maximum concentrations for carbon monoxide (CO).

The maximum ground-level concentrations predicted within the 10 km x 10 km model domain were compared with the applicable ambient standards described in Schedules A of the Nova Scotia *Air Quality Regulation* and the CCME Canada-Wide Standards.

BLACK POINT QUARRY AIR DISPERSION MODELLING STUDY

February 6, 2015

The predicted ground-level concentrations of the air contaminants were found to be at least 50% below their respective objectives, standards and criteria at the nearest discrete receptors.

5.0 CLOSURE

This report has been prepared for the sole benefit of Vulcan Materials Company (Vulcan). The report may not be relied upon by any other person or entity without the express written consent of Stantec Consulting Ltd. (Stantec) and Vulcan.
